Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

D1: FOOD; FERMENTATION

D11 : BAKING

ERA/ ★ D11 B/33 ★CS 7805-549
akes prodn. appts.
BERAN J 25.08.78-CS-005549
(30.04.79) A21c-11

ITT/ ★ D11 59937B/33 ★DL -135-991
Vheat-meal dough moulding process - by trimming endless strand, olling to coil and cutting to length
RITTER G 17.11.77-DL-202117
(13.06.79) A21c-03/10

oll-shaped wheatmeal dough mouldings for the prodn. of hite bread are made by kneading and rolling to an endless trip. After relaxation by transverse rollers and side rimming they are coiled up to a spiral roll, split transersely and passed to the dough raising section.

This is a much more economical process than the preent method with an intermediate raising period of 8-17 nins. The same machine can be used to prepare mouldngs for a wide variety of bread sizes. 17.11.77 as 202117 (4pp39)

RIED/ ★ D11 59938B/33 ★DL -135-992
Crusty roll dough preparation - on twin layer belt with slab halves olded over by lifting top belt layer
RIEDEL H 04.11.77-DL-201861
(13.06.79) A21c-11

Crusty roll dough is shaped on a conveyor belt consisting of two layers, stitched together along the centre line. One half of the upper layer is turned up to fold over the first half of the flat dough, followed by folding up the second half over the first. A foam rubber roller then forms the final shape.

This saves all manual labour and prevents the longitudinal compression. The greater percentage of crusty parts results in a more crips roll. 4.11.77 as 201861 (11pp39)

GEBH/ ★ D11 59982B/33 ★DL -136-210
Protein(s) partially hydrolysed by enzyme(s) - used as texture improving additives for foodstuffs esp. as freshness retention aids in bread
GEBHARDT E 20.01.78-DL-203327
(27.06.79) A21d-02/26

Foodstuff additives for imparting improved texture to bread and other confectionery, are made by partial hydrolysis of a protein (proteolysis) followed by treatment with an acid. The prod. may be dried or frozen for storage. When required for use, the material is thawed or rehydrated and/or neutralised and is then used, opt. together with further additives, in the prepn. of dough for the prodn. of bread and confectionery which retains its freshness longer.

Pref. protein is moist gluten or rehydrated vital gluten and the proteolysis is carried out in a kneader or stirred vessel with protease at the optimum temp. and pH. After proteolysis to the required consistency, the prod. is acidified e.g. to pH 3.5 to 4 with HCl and may then be (spray) dried, frozen or used directly.

Process allows proteins such as gluten to be converted into a liq. or powder prod. which can be incorporated into doughs to give baked prods. with improved freshness retaining properties, without delterious effects on the baked goods. 20.1.76 as 203327 (8pp513)

HAAS/ D11 56819T/36 =DS 2206-644
Wafer biscuit prodn machine - with two stage feed mechanisms for each leaf
HAAS F (HAA /) 11.02.71-OE-001180
*+Q35 (09.08.79) *DT2206-644 A21c-15/02*

A machine for the preparation of multilayer wafers consists of several (three) magazines for the wafers, each with a short extraction belt which deposits one wafer at a time on a main belt for the cream application station. Each extraction belt is followed by a shaft for the controlled lowering of a wafer on the main belt. An oblique light beam barrier in each shaft checks the drop of a wafer and cuts out the extraction conveyor. The next flights on the main belt conveyor switch the extraction belt on again.

This produces multilayer wafers automatically without risk of breakages or double layers. 11.2.72 as 206644 (4pp39)

ULLR/ D11 65207Y/37 =DS 2609-085
Bread dough contg. condiment mixt. - comprising sage, rosehips, summer savoury, marjoram, fennel, gentian and dill seed
ULLRICH H G 05.03.76-DT-609085
*(09.08.79) *DT2609-085 A21d-02/36 A23l-01/22*

Spice mixt. contains sage, rose hips, summer savory, marjoram, fennel, gentian and dill in the wt. ratio 1:1:1:1:0.5:0.5:1.5. It may also contain hibiscus blooms, coriander, strawberry leaves,mustard seed, aniseed and flax seed. The mixt. may be used to flavour bread dough. 5.3.76 as 609085 (2pp068)

ADLE/ ★ D11 60020B/33 ★DT 2742-818
Bread and rolls baking tin - with holes and inward prongs for better crustiness
ADLER N 23.09.77-DT-742818
(09.08.79) A21b-03/13

In a method of baking bread and crusty rolls the raised balls of dough are inserted on baking tins which leave the centre of the ball exposed by supporting it on radial prongs on the periphery of holes. These tins are loaded by forks into the oven and are deposited on the oven hearth.

Baking in direct contact with the hearth avoids the soft bottom of bread baked on solid tins. A crusty rind and a better taste are the result of the method, which also saves labour. 23.9.77 as 742818 (16pp39).

WERN ★ D11 60053B/33 ★DT 2804-545
Multideck baking oven - with brackets in large bread baking chambers for small pastry tins (NL 7.8.79)
WERNER & PFLEIDERER 03.02.78-DT-804545
(09.08.79) A21b-01/26

A multideck baking oven has several baking chambers on top of each other, each with a height of ≥ 150mm. Each bottom is designed as a heat storage plate. At half the height, each chamber has support plates for smaller pastry. Side perforations ensure a good circulation of hot air.

Parts of the baking chambers which are not needed for bread baking can thus be utilised for smaller pastry. 3.2.78 as 804545 (15pp39).

PROH/ ★ D11 B/33 ★HU T016-779
Crescent-shaped confectionery prods. mfr.
PROHASKA F 21.07.77-HU-PO0658
(28.07.79) A21c-13 A21d-13/08

SHIM- ★ D11 60535B/33 ★J5 4084-047
Preserving uncooked noodles - by coating with starch and/or starch deriv. contg. water-soluble antibiotic
SHIMADAYA HONTEN KK 14.12.77-JA-150306
(04.07.79) A23l-01/16

Process comprises spreading starch and/or starch deriv. contg. water-soluble antibiotic, onto the surface of the uncooked noodles having water activity 0.86-0.95.

Since the noodles have water activity 0.86-0.95 the antiboitic does not impregnate the noodles and remains on the surface giving antibiotic activity. Prods. can be preserved for >10 days without any change in quality.

Suitable starches and starch derivs. include +-lysed starch, acid-treated starch, organic acid ester of starch, phosphoric acid ester of starch, oxidised starch, etc.

Pref. antibiotics include organic acid (anhydrides) such as malic acid, malic anhydride, phytic acid, citric acid, fumaric acid, etc. lactones, such as glucono-γ-lactone, phosphates such as sodium metaphosphate, alcohols, such as propylene glycol, glycerin, etc. carbonates such as Na_2CO_3 and glycine (derivs.). 14.12.77 as 150306 (3pp5)

FREU- ★ D11 60536B/33 ★J5 4084-049
Powdered activated calcium stearyl lactate - for improving texture of bread dough, is prepd. by emulsifying the lactate in water with edible emulsifier and drying
FREUNT SANGYO KK 13.12.77-JA-149653
E12 (04.07.79) A21d-02/16

Prodn. of powdered activated calcium stearyl lactate (I), comprises (1) emulsifying calcium stearyl lactate (II) in water with addn. of natural edible emulsifier (III) other than protein, or mixt. of (III) and synthetic edible emulsifier (IV) and (2) drying the emulsion to powder.

Pref. (III) is tragacanth gum, gum arabic, guar gum, starch or dextrin. (IV) is methyl cellulose, carboxymethyl cellulose, propylene glycol aliginate, glycerin fatty acid ester, sucrose fatty acid ester, sorbitan fatty acid ester, etc. In the prepn. water is warmed to 80-90°C, (III) or (III) and (IV) is/are added to the water and(II) is mixed in. The wt. ratio of (III) or (III)+(IV) to (II) is 20/100-200/100.

(I) can be dispersed easily in the dough and does not coagulate. 13.12.77 as 149653 (5pp42)

CALP- D11 04736Y/03 =J7 9020-591
Powdered instant sponge cake mix - giving a cake by adding egg, milk, cream and water, without prepaing a batter
CALPIS FOOD IND KK 27.05.75-JA-062550
*(24.07.79) *J51139-661 A21d-13/08 +A21d-10/04*

The mix is prepd. by adding an emulsifier (e.g. monoglyceride and/or propyleneglycol-fatty acid ester) to oil and fat, mixing it with gluconodeltalactone and flour, with alkaline swelling agent, karaginan and skim milk and opt. mixing it with seasoning, such as powdered lecithin sugar salt etc.

The sponge cakes is prepd. without foaming. The cake -mix is stable for a long time. 27.5.75 as 062550 A21d-10/04 (24.7.79) CALPIS FOOD IND KK (4pp)(J51139661)

PETE- ★ D11 61423B/33 ★US 4162-887
Dispensing creme to surface of two streams of biscuits - from pair of valved heads rotating above biscuits
PETERS MACH CO 22.03.78-US-888867
*(31.07.79) B29f-03/**

Creme is deposited on the surface of a stream of biscuits advanced at a constant speed. The creme is discharged from a rotating stencil extending transversely above the biscuits and having a peripheral speed equal to that of the biscuits. This stencil has an annular port which is synchronised with the biscuits and the creme discharge is controlled by apertures in a non-rotatable stencil inside it. The appts. handles two streams of biscuits which are simultaneously coated from two ports mounted on a common stencil.

Inside the non-rotating stencil is a valve with apertures which can selectively close the apertures in the non-rotating stencil to adjust the relative flows onto each stream of biscuits.

Creme is supplied to the stencil from one end and the valve is used to equalise the flow rates onto each stream of biscuits. 22.3.78 as 888867 (8pp295)

CILE/ ★ D11 61504B/33 ★US 4163-065
Edible article for ingestion in religious ceremonies - consisting of unleavened bread and capsule, esp. contg. wine
CILEK E T 20.04.78-US-898451 (22.02.77-US-770397)
(D16) (31.07.79) A21d-13 A23l-02/02

Wholly edible article for ingestion at religious ceremonies consists of a crisp unleavened bread and a capsule of fruit flavoured material, physically joined together so that both components are visible.

The filling of the capsule is pref. wine. It can also be an unfermented fruit flavoured liquid, e.g. fruit flavoured oil, fruit juice or a saliva dispersible fruit flavoured solid.

The articles are storable and can be dispensed easily to large numbers of people without the risk of accidents associated with conventional wafers and wine. 20.4.78 as 898451 (6pp955)

D12: MEAT; FISH PROCESSING

BOOR/ ★ D12 B/33 ★CS 7803-595
Storage-stable poultry sausage
BOOR S 02.06.78-CS-003595
(30.04.79) A22c-11

ZIEM/ ★ D12 59894B/33 ★DL -135-856
Vacuum cutter and mixer for meat etc. - has lower housing section sealing edge running around cutter dish and arm sealing plate
ZIEMS W 24.04.78-DL-204966
P41 (06.06.79) B02c-18/16

The cutter dish is accommodated in an additional upper and lower housing section. The sealing edge of the lower housing section runs round the cutter dish, and to seal the opening formed by the recess through which the knife arm passes a sealing plate is provided.

The plate can have sealing material on the dish side, and it can be mounted on the knife arm at an obtuse angle to the sealing edge. 24.4.78 as 204966 (7pp160)

NMHB ★ D12 59939B/33 ★DL -135-993
Fish processing machine conveyor - with claw pairs self-adjusting for fish size against jockey pulleys
NORDISCH MASCH R BAADER 18.04.78-DL-204862
(13.06.79) A22c-25/08

An endless conveyor for a fish processing machine consists of two parallel V-belts each carrying a solid line of claws which form with their top faces a Y-shaped opening. These grip the fish on the dorsal line. Centre and side rails guide the claws along the working stretch, but allow the claws to rise against a jockey pulley weight if the fish height requires it.

The size of the fish thus does not require any adjustment to the conveyor which provides an efficient transport for a wide range of fish. 18.4.78 as 204862 (11pp39)

NMHB D12 22248B/12 =DS 2740-459
Fish position device - with pivoted guide rod pair for contra-rotating endless belts
NORDISCHER MASCHINE 08.09.77-DT-740459
*(09.08.79) *DT2740-459 A22c-25/12*

A new device for the belt conveyors of fish processing machines feeds the fish always at the same height just below the lateral vertebral extensions. The belt conveyor consists of two endless belts in a horizontal plane, with a gap between their strands which are turned towards each other. At the feed end and just below the bottom edges of the belts, a pair of guide rods accepts the fish with a bellmouth opening and compresses their ventral cavity.

This device is suitable for fish of all shapes and sizes. 8.9.77 as 740459 (4pp39)

SCHN/ ★ D12 60095B/33 ★DT 2805-035
Bone sawing machine - with paddle wheel feeding bones to multi-disc circular saw
SCHNELL K 07.02.78-DT-805035
(09.08.79) A22b-05

bone sawing machine includes a revolving paddle wheel hich is divided into sectors by radial blades. A contra-otating saw consists of a number (ten) of parallel circular aw discs which enter into slots of the radial blades.

This eliminates injuries because the bones need not be eld by hand any more. 7.2.78 as 805035 (12pp39).

EYN/ D12 19713A/11 =GB 1550-501
achine for cleaning fowl stomachs when giblets are removed - ligns carcass accurately to knife and presses it open
MEYN P 28.11.76-NL-013251
*(15.08.79) *BE-860-435 A22c-21*

oultry gizzards are split, cleaned and skinned in appts. hich includes an endless chain conveyor having protru-ions for holding the gizzards, a rotating knife to cut open he gizzards, a bar to fold open the split gizzards, a clean-ng device to empty the gizzards, and a set of rolls to emove the lining of the gizzards.

Two pressure discs mounted at a spocket wheel of the onveyor near the rolls press the gizzards onto the rolls. The discs have a greater dia. than the spocket wheel. Two ounter-rotating rolls pref. supply the gizzards to the end f the conveyor. 17.11.77 as 047882 (7pp1376)

EYN/ D12 34990A/20 =GB 1550-591
xtractor for cloaca of poultry - has accurately aligned, knife-entering pin preventing damage to carcass or entrails
MEYN P 24.01.77-NL-000677 (12.01.77-NL-000233)
*(15.08.79) *BE-862-059 A22c-21*

Appts. for cutting out the vent of a fowl has a hollow cyl-ndrical knife rotatable about a centre pin which is inserted into the vent to centre the knife, and a hollow driving shaft carrying the knife and being rotatably but axially mmovably mounted on the pin. The knife is connected to he shaft by a radial pin which extends into a helical slot n the knife so that the knife moves from an initial position allowing the centre pin to be inserted to a cutting position when the shaft rotates.

Pref. the centre pin is rotatable in the opposite direction to the knife and has a helical rib which slopes upward from the tip of the pin. The vent can be removed by cutting a smaller hole than previously. 12.1.78 as 001216 (12pp1376)

MEYN/ D12 34990A/20 =GB 1550-592
Extractor for cloaca of poultry - has accurately aligned, knife-centering pin preventing damage to carcass or entrails
MEYN P 24.01.77-NL-000677 (12.01.77-NL-000233)
*(15.08.79) *BE-862-059 A22c-21*

Appts. for cutting out the vent of a fowl as it is rotating supported on an overhead conveyor includes a slide block movable towards the fowl, a hollow knife on the block rotatable about a pin used for centring the knife on the vent, and a device for positioning the fowl adjacent the knife. The device has two members for bearing on the breast and the back.

The breast-bearing member pushes the fowl so that its vent passes the centre-line of the pin, and the back-bearing member briefly contacts the back to push the fowl backwards so that the vent lies directly on the centre-line of the pin. The 'rose-bud' is also in the dia. of the knife.

The size of the cut is greatly reduced. 12.1.78 as 27242/78 Div.ex 1550591 (10pp1376)

NIGY ★ D12 60539B/33 ★J5 4084-063
Euphausia Superba powder prodn. - by heating, sepg. liquor, treating liquor with hydrogen peroxide, sepg. suspension, concentrating supernatant, peroxide treatment and drying
NICHIRO GYOGO KK (TAIH-) 14.12.77-JA-150142
(04.07.79) A23l-01/32

Prodn. of powder of Euphausia Superba (I) caught around the South Pole, comprises (1) warming at 50-65°C, (2) sepn. of liquor, (3) treating the liquor with H_2O_2 (II) at 50-65°C, (4) sepg. suspending solid, (5) concentrating the supernatant, (6) treating the concentrate with H_2O_2 and (7) drying at ⩽65°C. The powder can be stored for a long period without oxidation of oil, than can original material.

The quantity of H_2O_2 used in (3) and (6) is 0.05-0.11 wt.% on starting material and the ratio of H_2O added in (3) is usually 20-40% on whole quantity of H_2O. 14.12.77 as 150142 (5pp42)

NISY ★ D12 60540B/33 ★J5 4084-064
Prodn. of powdered Euphausia Superba - includes adjusting the pH to acidic, heating and mixing with hydrogen peroxide to improve storage life
NIPPON SYNTH CHEM IND (TAIH-) 14.12.77-JA-150143
(04.07.79) A23l-01/32

Prodn. of powder of Euphausia Superba (I) caught around the South Pole, comprises (1) adjusting pH of (I) cut to small particles to acidic, (2) heating it to 50-65°C, (3) mixing it with 0.05-0.11 wt.%; of hydrogen peroxide (II), (4) sepg. liquid from solid, (5) concentrating the liquid, (6) mixing the concentrate with the solid sepd. in (4) and (7) drying the mixt. at up to 65°C.

(I) is of limited storage life, because oil in (I) is easily oxidized and (I) generates bad odor with discolouration of (I) to brown. The present powder of (I) can be stored for a long period without oxidation of oil. 14.12.77 as 150143 (5pp42)

AJIN ★ D12 60541B/33 ★J5 4084-065
Delicately flavoured food prodn. for use as relish - by moulding ground fish meat, seasoning and ammonium (bi)carbonate into plate, heating and roasting
AJINOMOTO KK 19.12.77-JA-152564
(04.07.79) A23l-01/32

Prodn. of a food (I) comprises (a) moulding mixt. of ground fish-meat (II), seasoning $(NH_4)CO_3$ (III) and $NH_3 . HCO_3$ (IV), to a plate, (b) heating it and (c) roasting its surface, resulting in expansion or foaming.

The quantity of (III) and (IV) is 0.05-2 wt.% e.g. (0.05-0.5 wt.%) on the wt. of (II) and the content of (II) in the mixt. is 40-70%. The temp. of heating in (b) is 40-85°C. After the step (b), the mixt. is pref. dried to water content of 15-25 wt.%, for effective expansion in (c).

(I) is used as a simple relish. When (I) is produced from (II) of low quality or (II) mixed with starch, egg, vegetable oil, etc. it does not expand enough by roasting. Sufficiently expanded (I) can be produced from (II) of low quality and (II) mixed with other materials. 19.12.77 as 152564 (3pp42)

NAKA/ ★ D12 60933B/33 ★J7 9020-587
Preserving the freshness of fish - by treating with water at pH 7-10 and contg. sodium acetate
NAKAMURA T 27.05.70-JA-044895
(24.07.79) A23l-01/32

Fresh fish is treated with a water of pH 7.0-10.0 containing 0.5-60% of sodium acetate. Freshness of the fresh fish can be maintained for a long period of time without damage the taste and flavour of the fish. 27.5.70 as 044895 A231-1/325 (24.7.79) NAKAMURA T (3pp22)

NAKA/ ★ D12 60934B/33 ★J7 9020-588
Maintaining freshness of animal meat etc. - by treating with aq. sodium acetate soln. at alkaline pH
NAKAMURA T 14.04.71-JA-023058
(24.07.79) A23b-04/14

Meat of animal, etc. is treated with a water of pH 7.0-10.0 which contains 0.5-60% of Na acetate. The meat can be kept fresh for a long period. 14.4.71 as 023058 A23b-4/14 (24.7.79) NAKAMURA T (3pp22)(J47035171)

Feed system for sepg. and orienting shrimps before peeling - has two vibratory feeders with intermediate air chute
KOCKEN A 20.03.79-NL-002171 (23.02.72-DT-208476)
(31.07.79) A22c-29/02

Device for sepg. and aligning shrimps whilst feeding them into a peeling mechanism consists of three feed conveyors, two of which are inclined upwards and equipped with vibrators whilst the third is a chute in the form of a U-channel. The floors of the two vibrator conveyors pref. comprise parallel grooves which are flat-round at the start and deep-round at the finish. This arrangement causes the shrimps that are individually fed onto the conveyor to lie with their backs in the wide groove.

Those that are still not correctly aligned fall through openings at the end of the first conveyor into the second conveyor. The floor of this conveyor is equipped with air openings in such a manner that the descending shrimp is caused to turn tail up before falling onto the third conveyor which is of similar type to the first. The shrimps coming from the two vibratory conveyors are fed, correctly oriented, into a peeling machine.

The device enables the peeling machine to function without the normal problem of incorrect orientation of the shrimp. 20.3.79 as 002171Div.ex.28.8.72-011720(8pp 1370).

LERE= ★ D12 61085B/33 ★SU -603-363
Sausage casing meat stuffing injection filler - has hollow and perforated auger shaft below feed hopper to prevent meat particles suction into vacuum system
LENGD REFRIG IND 17.01.77-SU-445160
(29.03.78) A22c-11/08

The efficiency and reliability of stuffing filling of sausage casings are ensured if the hollow part of auger shaft is below the charge hopper.

The suction of the stuffing is prevented by an auger in the hollow and perforated part of the shaft.

The helix of the inner auger is opposite to the flight of the outer auger which picks up the stuffing dropping by gravity from the hopper. The stuffing propelled by the auger is subject to vacuum, and meat particles dropped into the hollow part are fed towards the discharge port where they are mixed with the main mass.

Turning flexible tubular skin, e.g. sausages inside-out - so that skin can be internally coated without risk of damage
UNION CARBIDE CORP 23.12.76-US-753817
*A92 (31.07.79) *BE-862-205 A22c-13/02*

An elongated flexible tubing is turned inside out by humidifying a length of tubing to ≥8% moisture level w.r.t. total wt. of tubing, and shirring the humid length of the tubing to form a shirred stick.

The flexible tubing of the shirred stick is deshirred and everted by drawing one end of the tubing through the bore of the shirred stick and out through the opposite end. The deshirred tubing is then inflated as it exits from the stick bore; and the everted, inflated tubing subsequently flattened. Pref. the end prod. is wound into a roll, or shirred to form a shirred stick.

The process is esp. used for evaginating fibrous and cellulose tubing, such as an externally coated fibrous food casing. The process is effected without damage to the tubing. 23.12.76 as 753817 (5pp931)

Shirred sausage casing - reversible on filling with sausage meat prevent meat contact with casing fastening
UNION CARBIDE CORP 17.01.78-US-870198
(31.07.79) A22c-13

A shirred tubular casing has one end deshirred and dispo ed within the bore of the casing extending close to the sec ond end. The deshirred end is gathered and closed by an external clip. Material is fed into the casing and does no contact the clip. As the material is fed in the shirred ca -ing turns inside out so that the external surface of the shirred casing contacts the material.

The casing may be either a coated cellulose casing or coated fibrous casing.

The casing is used for various types of sausage produc The sausage product does not contact the fastening clip ar thus possible contamination is prevented. 17.1.78 as 870198 (5pp295)

ALFA D12 57096A/32 =US 4163-00
Sepn. of animal prod. esp. slaughterhouse waste into fat an protein - by mixing and partial heating then final heating an centrifuging
ALFA-LAVAL AB 27.01.77-SW-000842
*(31.07.79) *DT2802-271 A23j-01/02*

Animal raw material, such as slaughter-hour offal is sepd. into one fat fraction and ≥1 protein fraction. The prepn. comprises finely dividing the raw material, and subjecting it continuously to a first heating at a relatively low temp. of 45°-70°C and at constant viscosity.

The first heating is effected by circulating the divided material through a circuit which includes a heating zone and means to maintain constant viscosity. A stream of warm material from this circuit is then quickly heated to a higher temp. of 85-100°C. The flow is immediately sepd. by centrifugal sepn. to provide the fat fraction and the protein fraction. Water is then added to the materia subjected to the first heating.

The use of the circuit in the first heating stage preven collagene conversion into gelatine, which impairs fat and protein sepn. 24.1.78 as 871828 (4pp931)

HILL/ ★ D12 61503B/33 ★US 4163-06
de-shelled egg cysts obtd. from shrimp eggs - useful as a completel edible and hatchable aquaculture prod.
HILL M M 06.03.78-US-884067
C03 P14 (31.07.79) A01k-61 A23l-01/32

Denuded egg cysts (I) are obtd. by (a) soaking brine shrimp eggs (cysts surrounded by outer shells) in water saturate the eggs; (b) immersing the eggs in Cl-type oxi ising liquid medium at below 40°C to cause the shells to dissolve, and (c) sepg. the (I) and drying them at below 40°C.

The drying is pref. effected by placing the denuded cysts in a fine mesh bag and blowing air through it, or the cysts may be freeze dried. They are then packaged prevent exposure to ultra-violet rays or to moisture. Th oxidising liquid medium pref. consists of NaClO in an alkaline medium; household bleach may be used with dilution to provide the medium. Ice may be added to ensur that the medium remains at below 40°C while the shells the eggs are dissolving.

(I) are easily stored and handled, and they are viable and capable of producing brine shrimp cultures that are completely usable as food for all subjects of aquaculture, e.g. for tropical fish breeding and marine fish-rearing programs. The shrimp eggs are better utilised and the process is economical while giving increased yields. 6.3.78 as 884067 (4pp1248)

WILL/ ★ D12 61508B/33 ★US 4163-0
Shrouding freshly skinned carcass - in loose weave, cotto polyester cloth wetted with salt solution during cooling
WILLIAMS B E 04.05.77-US-793744
A97 F07 (31.07.79) A23b-04

A freshly slaughtered and skinned carcass is treated to smooth the fat surface increase surface whiteness and re duce shrinkage by applying a rectangular shroud cloth thoroughly wetted with salt soln. The cloth is a blend of cotton and polyester yarns with a density of <36 per inch in both directions to leave interstices for capillary attraction and ventilation and to accommodate skewers without extensive cloth damage.

The interstices retain the soln. and the cloth is tensioned with skewers to ensure that the interstices remain open when the cloth is wet. The shrouded carcass is kept in a cooling room until the shroud loses free surface moisture, when it is peeled from the carcass. Yarn density is pref. 24-36 per inch. 4.5.77 as 793744 (3pp1358)

NISSHIN OIL MILLS KK 16.12.77-JA-150676
(04.07.79) A23d-05 C11b-05

In the prepn. of fatty oil by blending lecithin and L-ascorbic ester monoglyceride of unsatd. fatty acid is coexisted with the fatty oil.

Transparent stable fatty oil contg. éffective amts. of lecithin and L-ascorbic ester (e.g. L-ascorbic stearate) is prepd. It has high stability against oxidn. and has good transparency matter has favourable transparency. Crystallisation, clouding and pptn. do not occur. 16.12.77 as 150676 (4pp170)

LIOC ★ D13 60532B/33 ★ J5 4084-040
Emulsified foods, e.g. mayonnaise or salad dressing, prepn. - by emulsifying aq. phase contg. locust bean gum and phosphate with oily phase contg. xanthan gum
LION DENTIFRICE KK 14.12.77-JA-150049
(04.07.79) A23d-05 A23l-01

Method comprises (a) combining locust bean gum and phosphate in aq. phase, (b) combining xanthan gum in oily phase, (c) adding the oily phase to the aq. phase and (d) emulsifying the mixt.

Emulsified food of high viscosity can be easily prepd. with relatively small amt. of emulsion stabiliser. At emulsification the mixt. is not highly viscous, but with lapse of time the xanthan gum in the oily phase is slowly transferred to the aq. phase and reacts with the locust bean gum. As a result the emulsion becomes viscous after the emulsification and a stable o/w type viscous emulsion is obtd. Although the synergic effect between locust bean gum and xanthan gum is usually very weak in acidic conditions, the effect is intensified by the presence of phosphate even in acidic conditions.

The locust bean gum, phosphate and xanthan gum are pref. used at 0.1-1.5 wt.%, 0.001-0.2 wt.% and 0.05-1.0 wt.%, respectively, w.r.t. the desired emulsified food. Method can be used for preparing mayonnaise, salad dressing, tartar sauce, sandwich spread, etc. 14.12.77 as 150049 (7pp5)

Oil-in-water emulsified food material prodn. - involves emulsifying solid oil and fat with emulsifier and water and diluting with aq. soln.
Q.P. CORP 14.12.77-JA-150283
(04.07.79) A23d-05 A23l-01

Method comprises emulsifying the solid oil and fat which is solid at > 0°C with an emulsifier and water to obtain an o/w type emulsion and diluting it with an aq. soln.

The o/w type emulsion is not converted to w/o type emulsion during its preservation. The obtd. o/w type emulsion can be preserved stably and can be added to a pickling soln. for ham and other aq. soln. to supply solid oil and fat.

As the emulsifier yolk and serum protein can be used and as emulsion aid animal, vegetable and microbial gum may be used. The diluting aq. soln. (water or an aq. soln. contg. salt, sugar, etc.) is used in an amt. of 20-100 pts. wt. w.r.t. 100 pts. wt. of the emulsion. 14.12.77 as 150283 (4pp5)

Freezing foods in aq. liquor of lower freezing point - comprising inorganic salt and organic salt and/or difficulty crystallisable or non-crystallisable organic substance
SEIWA KASEI KOGYO K 14.12.77-JA-149201
E12 (04.07.79) A23l-03/36

The method comprises freezing foods using a brine having freezing point 0-70°C, which is an aq. soln. contg. (a) inorganic salt and (b) organic acid salt and/or (c) difficulty crystallisable or noncrystallisable organic substance.

By controlling the amt. of the solute (a), (b) and/or (c), the freezing point of the brine can be lowered using a relatively small amount of inorganic salt and foods can be frozen with it without impairing their taste due to the impregnation of inorganic salt. The foods can be frozen at sufficiently low temp. in a short time, thereby maintaining the freshness of the foods and preventing loss of quality.

Suitably salt (a) is sodium chloride, calcium chloride, magnesium chloride, etc., salt (b) is sodium malate, sodium citrate, sodium acetate, etc.; and (c) protein hydrolysate, sorbitol, propylene glycol, etc.

Examples of brine and compsns. f. pts. are (1) 7% NaCl and 30% NaOAc soln. f. pt. -38°C; (2) 13.6% NaCl and 30% protein hydrolysate f. pt. -34°C and (3) 5% NaCl, 30% NaOAc and 10% propylene glycol, f. pt. -58°C. 14.12.77 as 149201 (3pp5)

Brussels sprout rotary stripper with blade retraction - enabling sprouts with stems of irregular thickness to be stripped without loss of speed

ALKEMADE A J C 26.01.78-GB-003179

*(30.07.79) A23n-15/**

Brussels sprouts are stripped from their stems by means of a rotating cutting head comprising two discs, the first of which carries a series of cutting blades whilst the second disc normally rotates with the first, but, on the application of a braking force to one of the discs, undergoes a limited angular displacement relative to the first disc.

Both discs are equipped with a central hole through which the stem of the brussels sprout passes. The blades are attached to arms which swing freely from pins on the surace of the first disc. The blades are restrained to move in toward the axes of the discs by springs. When it is wished to insert a stem, the brake is applied to one disc, whereupon the arms carrying the cutting blades are caused by the angular displacement of the two discs to swing away from the axis.

Once inserted, the brake is released and the blades are again pulled to the middle. As the stem is pulled through the discs, the blades strip the sprouts from the stem. Since the blades are individually sprung, they can readily accommodate variations in the thickness of the stem. 24.1.79 as 000561(10pp1370).

Vegetable oil prodn. from oil-contg. fruit - includes diluting pressed-out juice in water, adding yeasts or wine and pouring off surface oil
SAVKIN V A 01.09.76-SU-403703
(25.11.78) C11b-01

The process is used for producing vegetable oil from oil-contg. fruit, e.g. from sea buckthorn fruits. The fruits are pressed and oil is sepd. from the pressed-out juice. In order to simplify and improve the sepn. of oil and juice the process involves diluting the juice in water and adding to the obtd. soln. sugar in amt. 3-10% or wt. of mixt. and also 0.5-3% yeast or 2% wine. After mixing, the mixt. is held for 2-3 days at 20-50°C and the surface oil is poured off.

Apparatus for treatment of turbid liquid - by gas injection to form foam
GREEN G G 24.08.78-US-936640 (29.04.77-US-792099)
P41 (31.07.79) B01f-03/04 B03d-01/24

A turbid liquid is clarified by flocculation by injecting a gas to form a foam. The process is carried out using an injection vessel into which a gas is continuously injected into the liquid. A foam forms on top of the liquid while floc components form within the liquid. The foam is retained in the injection vessel to prevent its escape.

Gas escaping from the surface is reinjected into the liquid together with some of the foam to eliminate loss of liquid in the form of foam. The liquid is transferred to a closed flocculation vessel wherein the liquid is retained. It forms a three-phase system comprising liquid at the bottom, high solid floc on top, and on top of that frothing gas. Liquid and floc are withdrawn from their appropriate levels.

The system is used for clarifying a turbid liquid such as a fruit juice. The process results in an optimally clarified product with minimal loss of the liquid. 24.8.78 as 936640 (7pp295)

Waste water activated sludge plant with sec. activation tank - subdivided into a series of high efficiency oxidation chambers
BOHNKE B 15.04.78-DT-816390
(31.07.79) C02c

The plant is of the type employing a second stage activation tank subdivided into a number of aeration compartments in series. In each compartment the water is directed to flow horizontally. through a 180° Bend from inlet to outlet. Each outlet leads into a 180° horizontal return channel which discharges into the next aeration compartment.

Each compartment is now fitted with an airtight cover to form an oxidation chamber which is supplied with oxygen from an external source. The final compartment discharges into a return channel from which treated water can be extracted as the channel recycles water to the first compartment.

Each compartment cover pref. has integral, upstream and downstream walls which extend down into the water to isolate the compartments oxidation chamber from upstream and downstream return channels. The water is pref. driven through the compartments, e.g. by powered propellers fitted in the channels upstream of the compartments. Pref. about 20-25% of the tank area is occupied by the compartment covers.

Increased treatment capacity of new or existing installations is obtained economically without extending the size of installation. 13.4.79 as 875553(21pp448).

Water to be softened is passed through a cation exchanger layer which is removed after exhaustion and replaced by a layer of uncharged cation exchanger. An exchangeable insert for an ion exchanger-based water softener consists of 2 support layers enclosing an intermediate layer of powdery exchanger.

A water-softener is also claimed and consists of a container which is divided into 2 compartments by a partition which is formed, at least partly, as a water-permeable support layer. One compartment contains a closable inlet for the cation exchanger and a supply-conduit for hard water. The 2nd compartment contains a discharge outlet for soft water.

The water softener need not be regenerated with NaCl. 8.2.78 as 805308 (24pp200).

Dual bacteria-contg. waste water e.g. sulphite liquor treatment - by aeration and flotation with nutrient to microorganism ratio control
DEUTSCHE ITT IND 06.02.78-US-875327
F09 (09.08.79) C02c-01/06

Bacteria-contg. waste water is aerated under bacterial growth-promoting conditions, until the waste water BOD is noticeably reduced, pref. by 90%, and ratio nutrient materials:microorganisms in waste water is > 1.

The aerated waste water is introduced into a flotation cell to separate the suspended solid particles, including waste water bacteria, by dissolved air flotation clarifying. The suspended solids particles and bacteria are returned to the aerating step, in sufficient quantity to maintain the nutrient : microorganism ratio. The residual waste water, having a reduced BOD level is removed.

Use of the process for treating sulphite waste liquor, having BOD > 400 g/l, is claimed. Dual aeration and flotation treatment allows nutrient/microorganism ratio to be increased and treatment plant size to be reduced. Nutrient:microorganism ratio > 1-4 greatly lowers BOD and toxicity. The process is immune to shock loading. 31.1.79 as 903548 (17pp200).

Floating aerator structure - with tubular truncated pyramid suspended from floats
TATABANYAI SZENBANYAK 08.02.78-HU-TA1474
Q24 (09.08.79) B63b-35

A floating support structure, e.g. for surface aerators of water or for other floating structures, consists of a frame on which the aerator is mounted. This forms the narrow end of a truncated pyramid, formed by tubes along the side edges of the pyramid, and joined to nodal points of the base tubes. These nodal points are the attachments for the floats on which the whole unit is suspended. The floats are preferably hollow or opt. filled with a plastics foam.

This is a simple and lightweight construction. It is easy to mfr., to instal and to service and can be universally applied independent of the environmental conditions. 8.2.79 as 904816 (15pp39).

DORO D15 27616Y/16 =GB 1550-342
Screening and maceration of refuse in sewage - for concn. on concave grid and treatment in screw press
DORR OLIVER INC 16.12.75-GB-051405 (11.07.75-GB-029188)
*P41 (15.08.79) *FR2317-012 C02c-01/22*

Sewage screenings are treated by passing added water and the screening through a disintegrator or macerator and dewatering at least a portion of the slurry produced on a concave sieve bend screen.

Pref. the bars of the screen are spaced by 0.7 to 1.5mm, and have a face width of 2 to 4 mm. The subtended angle of the screen is pref. 40 to 60°. The macerator pref. reduces the screenings to 1/8 to 1/2 inch particles. The portion of the slurry not dewatered is pref. recycled to the macerator.

The dewatered slurry can be used for landfill or can be acceptably incinerated. 22.4.76 (5pp1376)

SUMQ ★ D15 60294B/33 ★J5 4082-845
Treatment of acidic waste liquor, e.g. steel pickling effluent - by adding alkali, oxidising agent and alkali to ppte. magnetic iron oxide and phosphoric ion as iron salt
SUMITOMO METAL IND KK (SUMI- YOKO-) 13.12.77-JA-150174
E31 M12 (02.07.79) C02c-05/02

An acidic waste liquor contg. a large amt. of phosphoric ion and ferrous salt, e. g. pickling effluent resulting from steel plant, etc. is treated by previously adding alkali to adjust its pH to a weakly acidic range; adding an oxidising agent, e. g. H_2O_2 etc. to selectively ppte. the phosphoric ion as iron salt; adding an oxidising agent, e. g. H_2O_2 etc. to the supernatant liquor to convert by oxidation a portion of ferrous ion to ferric ion; and subsequently adding alkali to ppte. the Fe ion in the form of magnetic iron oxide.

Advantages are that all of the ferrous ion is easily recovered as valuable magnetic iron oxide in closed recirculating system; the formed magnetic iron oxide exhibits settling rate than that of ferric hydroxide, and the apparent volume of a sludge is very small, and further heavy metal ions coexisting in the liquor in very small amt. are coprecipitated with the magnetic iron oxide. 13.12.77 as 150174 (4pp34)

NITT ★ D15 60355B/33 ★J5 4083-085
Acrylamide polymer prepn. for use as waste water coagulant - comprises polymerising acrylamide in water in the presence of a water-soluble tert. alcohol

Treating sludge of high water content - by adding coagulant, comprising alkali extracted from slag from shaft furnaces, to sludge in mixer

HITACHI SHIPBLD ENGG KK 16.12.77-JA-152051

(03.07.79) B01d-21/ B01j-01*

A sludge with high water content is spread on the ground and reclaimed after treatment. To reduce the treatment cost, a coagulant composed of alkali extract from a granulated or powdered slag drained from shaft furnaces, is added to the sludge, by feeding it into a mixer.

Typically, a flocculant is fed from a feeder into a tank and the sludge is stirred in it. The sludge is then drained to a sludge concentrator and is left to precipitate, while the supernatant liq. is removed. The concentrated sludge is carried to the mixer through a conveyer pipe, into which the granulated slag is added as a coagulant during conveying. 16.12.77 as 152051 (3pp26)

Phenol removal from effluent water from coal gasification - by solvent extraction and washing of the acid gas with raw phenol
METALLGESELLSCHAFT AG 24.06.75-DT-527983
*E14 H09 (31.07.79) *DT2527-983 +B01d-19 B01d-53/14*

Phenols and the volatile cpds. NH_3, CO_2 and H_2S are removed from waste water resulting from gasification or degasification of coal. Removal is by means of liq/liq. countercurrent extraction of the phenols with isopropylether to achieve a phenol laden solvent layer and a dephenolised aq. layer, by a organic layer. This is followed by 2 consecutive distillation steps for separate recovery of CO_2 and H_2S solvent and NH_3 with a low acid gas content.

The process comprises mixing the waste water with low b.pt. organic solvent, separating the mixt. into a solvent- and aq. layer; stripping the vapours of CO_2, H_2S and solvent from the aq. layer at super-atmos. pressure; stripping off the NH_3 from the aq. layer to leave a refined aq. prod. layer suitable for discharge.

The stripped vapours are then scrubbed under super-atmos. pressure with a portion of the cold refined prod. to remove any organic solvent. Part of the solvent is condensed and separated under superatmos. pressure, and the remaining acid gases still contg. NH_3 and solvent scrubbed with recirculated cooled raw phenol to remove NH_3 and the solvent. 30.9.77 as 838429 (+ 4.6.76 - US - 693040) (2pp931)

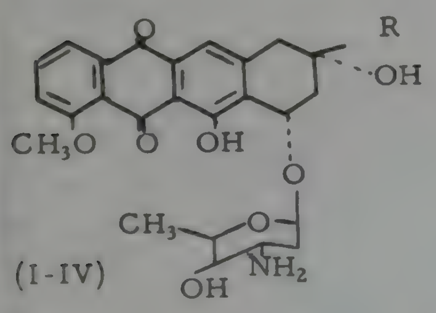
B03 (08.08.79) A61k C07d C12d

Prodn. of an antibiotic complex contg. anthracyclin glycosides comprises aerobic cultivation of a new mutant strain of Streptomyces peucetius var. caesius in an aq. medium contg. assimilable C and N sources and inorganic salts. The new strain is specifically B211 F;I. (Farmitalia collection; classified as Micromonospora peucetica sp. nova) made by treating the parent species with N-methyl-N'-nitrosoguanidine.

The glycosides of formulae (I) - (IV) and their nontoxic acid addition salts are new: (I) has R=$COCH_2OH$, i.e. 11-deoxy-adriamycin; (II) has R=$CHOH.CH_3$, i.e. 11-deoxy-13-dihydrodaunomycin; (III) has R=$COCH_3$, i.e. 11-deoxy-daunomycin; (IV) has R=ethyl, i.e. 11-deoxy-13-deoxodaunomycin. The corresp. aglycones are also new.



(I-IV)

(I)-(IV) have antitumour and antibacterial acitivity. (I) is active against P388 leukaemia in mice at 66 mg/kg and is toxic at 100mg/kg. At the tolerated dose it is more effective than daunorubicin. 8.2.79 as 874032(22pp1251).

Antigen for malignant tumour diagnosis - obtd. from tumour tissue by neutral salt extraction, protein and molecular sieve techniques

WERNER H 16.09.76-DL-194813

B04 (06.06.79) C07g-07 C07g-17

Tumour antigen with general, non-histospecific relation to malignity is produced from native, homogenised tumour tissue by neutral salt extraction, protein pptn. and molecular sieve techniques.

In a pref. procedure, the homogenised tumour tissue is subjected to hypertonic neutral salt extraction. The extract is ultracentrifuged, then concentrated and the antigen pptd. with satd. ammonium sulphate soln. The ppte. is redissolved and further purified by gel filtration, a product in the molecular weight range 30000-200000 being collected. The antigen can be isolated from the resulting protein mixture by diafiltration, a product of molecular wt. 40000-70000 being collected.

Used for immunological diagnosis of malignant tumours pref. using lymphocytes from the patient under examination. 16.9.76 as 194813 (8pp280)

Wort clarification in beer breweries - by flotation using carbon di:oxide as carrier gas

BORKMANN K 21.04.78-DL-204942

(06.06.79) C12c-09/06

Wort can be clarified in beer breweries by a flotation process. The flotation is effected by an admixture of carbon dioxide, pref. recovered from the fermentation processes. After a certain retention time of the carbon dioxide at a pressure of 2-4 bar, the mixt. is expanded in the flotation cell and the suspended slimes are removed.

The small vols. and low pressures of the gas result in little froth formation combined with a high sepn. efficiency Very small gas bubbles are produced to give a max. of phase interface area. 21.4.78 as 204942 (6pp39)

PORS/ ★ D16 59960B/33 ★DL-136-140

Peroxidase-labelled protein purificn. - by combination of affinity chromatography and gel filtration

PORSTMANN T 28.04.78-DL-205079

B04 C03 (20.06.79) C07g-07 C07g-11

In the purificn. of peroxidase-labelled proteins, free peroxidase and all unlabelled antibody or antigen are removed in a single step by combination of affinity chromatography and gel filtration. The affinity chromatography sepn. is carried out with Concanavalin A/"Sepharose" (RTM) while the gel filtration is pref. effected with a carbohydrate and/or acrylamide gel.

Peroxidase-labelled antibodies are used in the enzyme-linked immunoassay of immunogenic substances (proteins, carbohydrates, nucleic acids, drugs) in medicine, sports medicine, veterinary medicine, biochemistry, immunobiology, zoology, food chemistry, pharmacology and toxicology.

The process enables peroxidase-labelled prods. with high specific activity to be obtd. in a single step. 28.4.78 as 205079 (15pp280)

BORM/ ★ D16 59968B/33 ★DL-136-152

Preventing oxidn. of boiling, foaming wort infusion - by blowing jets of carbon dioxide through flat nozzles upon surface of broth

BORKMANN K 28.04.78-DL-205088

(20.06.79) C12c-09/02

Undesirable oxidn. during the boiling of wort is avoided by blowing CO_2 upon the frothing surface of the infusion, through nozzles. The CO_2 is available as a by-prod. of beer brewing. Discolouration of the resulting broth by formationof 5-hydroxymethylfurfurol is minimised.

The CO_2 is supplied under up to 0.1 bar super-pressure. The nozzles are flat-jet nozzles. Formation of froth upon the surface of the boiling mass is appreciably reduced. 28.4.78 as 205088 (5pp267)

DEAK ★ D16 59997B/33 ★DL-136-268

Affinity chromatography isolation of sugar specific enzymes - using hydroxyalkyl methacrylate macroporous copolymer contg. glycoside-bound saccharide

AKAD WISSENSCHAFT DDR 04.05.78-DL-205175

A97 B04 C03 (A14) (27.06.79) C07g-07 C08l-33/04

In the isolation of enzymes using saccharide-contg. carriers, a soln. contg. an enzyme or enzyme mixt. is contacted with a macroporous hydrophilic copolymer of hydroxyalkyl methacrylate (alkyl = 2-6C) contg. O-glucosidically bound saccharide, and the enzyme is released from the resulting complex by elution with salt solns., solvent mixts. or buffers.

Used in isolation of enzymes and proteins which form substrate complexes with saccharides. New adsorbents for affinity chromatography have improved hydrophilic properties. The macroporous internal structures gives a large pore dia. and high specific surface. The matrix has improved mechanical, thermal and chemical stability, and is not attacked by micro-organisms. The vol. of the adsorbent remains constant over a wide range of pH and ionic strength values. 4.5.78 as 205175 (11pp280)

DORI/ ★ D16 60005B/33 ★DL-136-287

Centrifugal pump for fermentation emulsion contg. gas - has baffle ring between back of impeller and gas release openings in casing

DORING W 02.03.77-DL-197627

Q56 (27.06.79) F04d-29/24

The pump has centrifugal blades projecting axially from a backplate. A connection within the casing from the space at the back of the impeller leads into a gas release chamber with a gas outlet. There is a baffle ring behind the impeller backplate. It is joined at its inner end to the impeller hub.

The outer radius of the ring is greater than the radial distance of the gas release connection but less than the inner radius of the ring of liquid which forms behind the impeller. The ring is spaced axially between the impeller backplate and the back wall of the casing. 2.3.77 as 197627 Add. to 101947 (13pp1013)

Prodn. of hydantoinase standard sample comprises culturing microorganism in culture medium contg. pyrimidine series nucleic acid base or its deriv. (0.05-0.5%) to accumulate hydantoinase in fungi body. Pref. nucleic acid base (deriv.) is selected from uracil, cytosine, thymine, dihydrouracil, dihydrothymine, uridine, cytidine, uridine, monophosphate or cytidine monophosphate.

Pref. microorganism is selected from Aerobacter, Agrobacterium, Brevibacterium, Corynebacterium, Microbacterium, Brevibacterium, Corynebacterium, Microbacterium, Micrococcus, Pseudomonas, Microbacterium, Nocardia or Streptomyces gunus. Pref. hydantoinase standard sample is fungi body, fungi body-treated substance, fungi body extract, crude enzyme, purified enzyme or fixe substances.

D-N-Carbamoylamino acids may be converted into respective corresp. optical-active D-amino acids and these are important as intermediates for pharmaceuticals and those enzyme standard samples are very useful in industrial practice. 9.12.77 as 148556 (10pp69)

TOKU ★ D16 60546B/33 ★J5 4084-088
Reaction using fixed enzyme - comprising mycelium or enzyme fixed on water insol. polyion complex of cationic and anionic polymers
TOKUYAMA SODA KK 16.12.77-JA-150592
A96 B04 (04.07.79) C07g-07/02

A method for reaction of fixed enzyme (I), comprises using, as (I), enzyme (II) or mycelium (III) fixed on water-insoluble polyion complex (IV) composed of polycation polymer (V) and polyanion polymer (VI). The fact that (II) or (III) is fixed on (IV) is new.

(II) or (III) is fixed by (1) addn. of polymer ion, having reactive charge to aq. soln. contg. (II) or (II), and (V) or (VI), or (2) contacting (II) or (III) with (IV) in aq. soln. One of (V) and (VI) is pref. water-soluble. As (III), culture medium mycelium, grinded mycelium, crude enzyme-extract, etc. of mycelium contg. glucose isomerase or cis-epoxy succinic acid hydrolase, and as (II) invertase are pref. used .

Examples of (V) and (VI) are strong acidic water-soluble polyanion, such as polystyrene sulphonic acid, polyvinyl sulphate, etc. weak acidic water-soluble polyanion, such as polyacrylic acid, polyglutamic acid, etc. strong basic ammonium salt, etc. weak basic water-soluble polycation such as polyethylene imine, etc. 16.12.77 as 150592 (7pp42)

Fixation of enzymes - by gelation of a soln. contg. coagulative devil's tongue mannan, enzyme and other additives
OKIMASU T 19.12.77-JA-151669
B04 (04.07.79) C07g-07/02

A method for fixation of enzyme (I) comprises gelation of a solution contg. coagulative devil's tongue mannan (II), enzyme and, if necessary, one or more (I)-protecting agent, stabiliser, coagulant, neutralizing agent and peptising agent (III).

(II) is e.g. prepared by (1) (a) making gel of devil's tongue mannan solution by addition of alkali and allowing to stand for a proper period of time, (b) grinding the gel obtained, (c) washing it with water, (d) peptising it with addition of (III) at low temp., (e) neutralising it and (f) dialysing and/or filtering the solution.

The gelation of the solution is more promoted at lower temp. and therefore lowering of activity of (I) by heat is not caused during the treatment. Procedures are simple. 19.12.77 as 151669 (4pp42)

TOXN ★ D16 60548B/33 ★J5 4084-090

Solvent mixt. for activating beta-galactosidase - contg. water miscible alcohol(s) and ketone(s)

TOYO BREWING KK 04.11.77-JA-132714

B04 R16 (04.07.79) C07g-07/02 G01n-31/14

Solvent mixture (I) which activates β-galactosidase (II), contains $\geqslant$ 1 water miscible alcohol (III) and ketone (IV).

By contacting (II) with (I), activity of (II) increases 2-3 times. (I) is effectively used for enzyme immunoassay. Examples of (III) and (IV) are 1-3C alcohol, e.g. (m)ethanol, propanol, propylene glycol, glycerin, and acetone and methyl ethyl ketone. The contents of (III) and (IV) in (I) is 5-30%. Cpds. (V) having thiol gp. e.g. glutathion, mercaptoethane, etc. and buffer of pH 6.8 are pref. added in (I). The content of (V) in (I) is 1-30 mM, e.g. (10-25 mM). (I) can also be applied to (II) fixed on cellulose, ethyl cellulose, styrene, ion exchanger, etc. As the compounds used for enzyme immunoassay, antigen, antibody, hapten, such as insulin, albumin, immuno globulin, catechol amine, etc. are used. 4.11.77 as 132714 (10pp42)

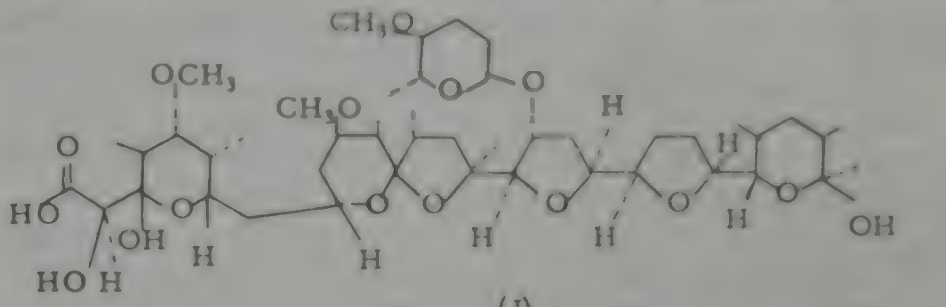
Anticoccidial antibiotic 6016 - prepd. by culturing Streptomyces genus microorganism

KAKEN CHEM KK 14.12.77-JA-149354

B03 (05.07.79) A23k-01/17 A61k-31/71 C07h-17/04 C12d-09/14 C12d-13

Antibiotic 6016 of formula (I) is new. (I) is prepd. by culturing a microorganism belonging to Streptomyces gunus and recovering the antibiotic from the resultant culture.



(I)

The antibiotic is effective to wide variety of Gram-positive and acid fast bacteria and fungi (esp. Bacillus subtilis PCI-219, B. cereus IAM-1729Y, Staphylococcus aureus FDA-209P-JCI, St. aureus, Micrococcus flavus IFO-3242, Mycobacterium avium IFO-3153, My. smegmatis ATCC-607, Alternaria kikuchiana, Diaporthe citri and Piricularia oryzae, and coccidium germ esp. Eimeria tenella. 14.12.77 as 149354 (9pp38)

SHIN- ★ D16 60868B/33 ★J5 4085-909

Seed contg. tablet e.g. for aquatic rice - first coated or impregnated with spores or bacteria, then coated with calcium peroxide and sand and then with outermost layer

SHINSHU KAGAKU KENK (MAED- NIPE-) 17.12.77-JA-152133

C03 P11 (09.07.79) A01c-01/06

A seed-contg. tablet is claimed designed with a view to sound growth and harvest of aquatic rice, cucumber, carrot, radish, and other vegetables. Tablet mfrd. by providing the surface of the seed of a vegetable as a core with active spores and its substratum with an effective germ for agriculture, e.g. Azotobacter agilis (IFO No. 3741), Acetobacter aceti (IFO No. 3281), Sacharomyces cerevisiae (IFO No. 0538 and IFO No. 0304), Lactobacillus acidophilus (IFO No. 3205), Lactobactillus batatas (IFO No. 12455), Streptomyces aureus (IFO No. 3175), etc. which are used in a combination of $\geqslant$2 species, then the surface of the spore and its substratum of the effective germ for agriculture is provided with a layer of calcium peroxide and sand, then the surface of the calcium peroxide and sand layer is provided with gelatin, clay, plastics, etc., to form the outermost layer of the seed-contg. tablet.

Tablet can be directly sown without the need for transplanting young aquatic rice plant, e.g. bred in breeding bed. 17.12.77 as 152133 (6pp117)

NIFE- ★ D16 60870B/33 ★J5 4085-941

Activator and compost for mushroom cultivation - comprises straw and nitrogen fixing component contg. phosphorus pent:oxide, silica, etc.

NIPPON FELLOW KK (TOSH-) 17.12.77-JA-152214

P13 (09.07.79) A01g-01/04

An activator and compost for the cultivation of mushroom comprises 100 wt. pts. of straw and 0.5-7 wt. pts. of an activator or nitrogen fixing component composed of 3-61 wt.% of P_2O_5 (40% of total P_2O_5 are water-soluble and the rest are citric soluble), 0.5-25 wt.% K_2O, 0.5-60 wt.% CaO, 0.1-25 wt.% MgO, 5-55 wt.% SiO_2, and 0.5-35 wt.% Al_2O_3 or a mixture of Al_2O_3 and $\geqslant$ 1 of MnO_2, B_2O_3, CuO, ZnO and MoO_3.

The mfg. process of the activator and compost is highly simplified, e.g. it takes 8-12 days, approx 1/2 of that of the conventional methods, and also turnover operation during mfr. is less than one time. The growth of saprophyte during mfr. is very low; and an increased yield of mushroom can be attained because of well-balanced supply of nutrients. 17.12.77 as 152214 (4pp117)

FUJI/ ★ D16 60871B/33 ★J5 4085-942

Inoculation of edible fungi - by mixing solid culture seed fungus with thickener and water, and inoculating onto wood for cultivation

FUJIMOTO T 16.12.77-JA-152146

A97 P13 (09.07.79) A01g-01/04 C12k-01

Inoculation of edible fungi, partic. Cortinellus Shiitake fungus, comprises mixing solid culture seed fungus cultivated in sawdust, etc., immediately before its inoculation onto wood for cultivation with $\geqslant$ 1 thickener, e.g. cellulose derivatives, starch, glycerine, polyvinylalcohol, sodium alginate, etc. and water to form a viscous fluid, and then the viscous fluid contg. solid culture seed fungus is inoculated onto wood for cultivation.

The working efficiency can be greatly improved because the fluid inoculation of edible fungi is possible without special equipments and technologies for performing liquid culture, and also the growth of fungi after inoculation can be greatly improved because there is no danger of the intermixture of saprophyte. 16.12.77 as 152146 (3pp117)

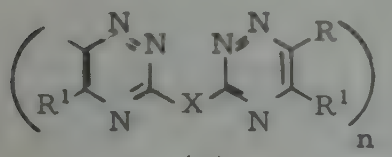
PHAR- D16 25705A/14 = J7 9020-472

Microporous ultrafiltration membranes - prepd. from hetero-aromatic polymers, used e.g. for filtering or concn. of fluids for intravenous infusion

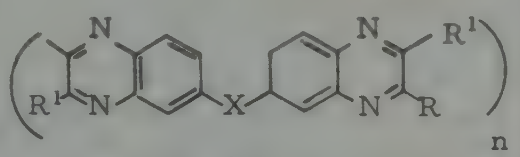
PHARMACO INC 29.09.76-US-728453

*A88 B07 J01 +P34 (A96 D15) (23.07.79) *DT2743-673 B01d-13/04*

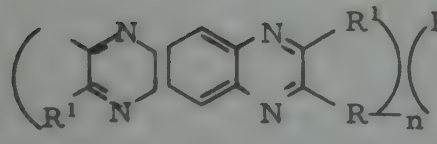
Micro-porous selectively-permeable membranes are made from hetero-aromatic polymers of formulae (A)-(F):-



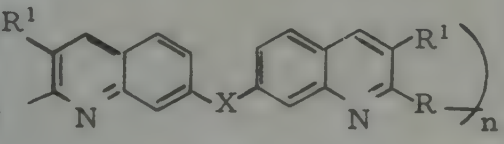
(A)



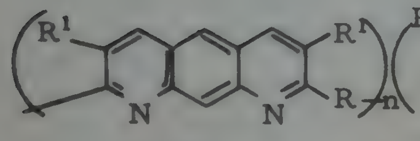
(B)



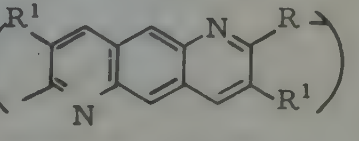
(C)



(D)



(E)



(F)

In the formulae R is phenylene, diphenylene  naphthylene, pyridylene, or 1-6C alkylene, Y is a direct bond, O, S, SO_2 or CH_2; R^1 is H or an aromatic or aliphatic gp. X is as Y or an isopropylene, CO or pyridylene gp. and n is 10-10000.

Membranes are made by casting a soln. of the polymer and contacting the thin layer with a non-solvent. Used for filtering or concn. of fluids for intravenous infusion to remove non-living particles, bacteria or viruses. Also for concn. and filtration of protein solns. clarification of wine, beer and syrups, removal of particles and germs from medicines water and chemical solns. etc. The membranes do not compact under pressures ⩽ 70 bar, resist soln. at pH 1-14 etc. 28.9.77 as 116546 (clg.29.6.76-US-728453) B01d-13/04 (23.7.79) PHARMACO INC (9pp) (J53043086)

Industrial fermentative amino acids prepn. from cheap carbon sources - using propionic acid or propionate and Corynebacterium

AJINOMOTO KK 00.00.75-JA-144217 (28.02.73-JA-024049)

*B05 E19 (24.07.79) *J52001-091 C12d-13/06*

The method involves culturing of Corynebacterium to produce amino acids such as alanine, arginine, histidine, histidinol, leucine, lysine, phenylalanine, proline, valine, tryptophan, homoserine, ornithine, threonine, isoleucine, or diaminopimelic acid. Propionic acid or propionate is used as the major carbon source for the culture medium. The culturing is generally effected at 24-37°C for 2-5 days at pH 5.0-9.0.

Generally, the growth of microorganism ishindered in culture medium of high propionic acid concn. so it is necessary to maintain propionic acid concn. below 2% (favourably 0.5-1.5%). The propionic acid (or propionate) is added continuously or intermittently during the fermentation to maintain the concn. in the above range.

Propionic acid and propionate are petrochemical prods. which have not previously had a worthwhile use. 28.2.73 as 144217/75 Div. ex 24049/73 C12d-13/06 (24.7.79) AJINOMOTO KK (4pp)(J52001091)

ALFA ★ D16 60966B/33 ★NL 7900-803

Continuous prodn. of ethanol - by fermentation of a carbohydrate source, centrifugal sepn. of yeast and distn. of the yeast-free stream

ALFA-LAVAL AB 31.01.78-SW-001133

E17 (02.08.79) C12b-01 C12c-11/14

Volatile organic cpds. esp. ethanol, are made by continuous fermentation of a carbohydrate-contg. substrate in a fermentation tank. A stream of the fermentation liquor is sepd. by centrifuging into ⩾1 yeast concentrate stream and a yeast-free stream. The yeast concentrate stream is recirculated to the fermentation tank and the yeast-free stream is sepd. into a stream which is enriched in the desired volatile organic cpd., which is recovered, and a residual stream which is at least partially recirculated to the fermentation tank.

Process allows ethanol to be made continuously using relatively conc. fermentation liquors, so that the amt. of environmentally-polluting dil. waste liquors produced in the process is small c.f. prior art. The ethanol is a useful raw material and is becoming increasingly important as a replacement for fossil fuels. 31.1.79 as 000803 (16pp513).

B05 (25.11.78) C12d-13

Cytidine-5'-diphosphate choline is produced by biologically phosphorylating a mixt. contg. a microorganism biomass (pref. yeasts), a choline deriv. a sugar source, $MgSO_4$, a phosphate buffer (pH 7.0) and water at 30°C, the prod. is subsequently purified.

The yield is increased by 30% by keeping the biomass before the phosphorylation, in the phosphate buffer at -20°C for 2-4 days; then adding 0.05-0.1 mg/ml of a green algae extract, 7-8 mg/ml of adenosine-5'-triphosphoric acid and, as a source of sugar, 10-30 mg/ml of 1,6-diphosphate-fructose. The title cpd. is used for the biosynthesis of phospholipides, and also as a medicine for brain diseases.

By this method, activated enzyme complexes are liberated.

2-O-Methyl-D-rhamnose microbiological prodn. - using Bacillus Faecalis alcaligenes strain 6 producer to reduce mfr. costs
AS UKR MICROBIOLOGY 15.06.77-SU-498635
E13 (25.11.78) C12d-13/04

2-0-Methyl-D-rhamnose, used in the microbiological inds. is produced in a simplified manner by cultivating Bacillus alcaligenes strain 6 in a nutrient medium. The strain was isolated from bile. It is gram-negative. It appears in the form of mobile, short rods (0.5-1-2u) It is grown in a meat-peptone agar or broth at 37°C for 1-2 days, under aerobic conditions.

The bacterial mass is washed with a physiological soln. dried with acetone and ether, and the specific polysaccharide is extracted by the known method.

Catalase and gluco-oxidase microbiological prodn. - using specified penicillium fungal strain to increase yield and reduce mfr. costs
GULYI M F 14.06.77-SU-496287
(25.11.78) C12d-13/10

Catalase and glucosooxidase are sepd. from cultures of the mould fungus Penicillium vitale Pidopl, et Bilai by adsorption on kaolin in an acidic medium, with subsequent elution with a phosphate buffer, precipitation with an organic solvent, purificn. and drying.

The process is improved by additionally extracting the enzymes from the mycalium of the fungus; the mycelium is sepd. from the culture before the introduction of the kaolin adsorbent, then comminuted and subjected to extraction with a 3- to 4-fold volume of water. Catalase and glucosooxidase are adsorbed from the aq. extract at pH 4.0-4.3 and 3.4-3.5 respectively. By this method, the total yield of the enzymes is increased by 40-60%. Glucosooxidase is widely used as an antioxidant, and also for the medical analysis of glucose. Catalase is used in the fermentation industry.

Vodka from wheat source alcohol prodn. - includes use of softened water and multistage activated carbon treatment
FERMENT PRODUCT RES (MOLI=) 26.05.77-SU-491030
(10.11.78) C12g-03/04

Vodka "Pshenichnayer" (RTM) is a wheat vodka produced by softening water with a sulphocarbon removing organic contaminations by filtration through activated carbon, mixing the purified water with alcohol; filtering again and pouring into containers.

The quality of the prod. is improved by carrying out the filtration of the water before the softening. Before the pouring into containers, the vodka is kept for 2-4 h at 10-20°C to stabilise the taste. The treatment with activated carbon is carried out at a rate of 300-400 l/h.

Wine storage reservoir level compensator - includes temperature transducer and induction coil with float stem as core for easy servicing
PROD PROCESS AUTOMA 11.01.77-SU-444053
(10.11.78) C12h-01/22

The servicing and accounting of wine volume for compensation of its changes are simplified and accelerated by a make-up tank connected to the reservoir and contg. a unit for pressure balancing. The unit for scaling the wine volume includes a temp. transducer and an induction coil with a core in the form of float stem at the lower end. The stem carries the sealing diaphragm cover.

The pumped liquid raises the pressure in the system and lifts the float with the stem closing contacts and opening the valve. As a result, air is exhausted into the atmosphere through the tube of calcium chloride whose filtering properties trap valuable substances entrained by air. The condensate is returned to the balancing tank. With fluid level reaching the transducer, the pump is cut off till the float contacts the liquid in the balancing tank.

In apparatus for winding a back cloth or a fabric round a decatising cylinder, the winding cylinder is located below an unwinding decatising cylinder. The back cloth or fabric is allowed to drop under its own weight to pass its leading edge to the winding cylinder to be caught. The remainder of the material is then passed to the winding cylinder.

Process reduces the still time of the machine while passing the leading edge of the material to the winding cylinder.

Combined sugar beet chipper and electro-plasmolyser - has knives and electrode strip mounted in a frame with strips completing electric circuit
KIEV FOOD IND TECH 01.06.77-SU-493971
(10.11.78) A23n-01

Device for cutting sugar-beet and simultaneous electroplasmolysis of the chips, comprises a body, frame to which the knives and electrode are fastened, with the electrode connected to one of the terminals of a source of an electric current. Plasmolysis effectiveness is increased by making the electrode as a movable strip fastened to the frame by means of an insulation intermediate layer. The other pole of the current source is connected to the frame. The body also has hollows, and the frame and strip have contact pins which are disposed inside the hollows.

Sugar prodn. aq. extract purificn. - includes passing direct electric current at elevated temp., using soluble aluminium-magnesium anode
SUGAR IND RES INST 01.06.77-SU-491715
(10.11.78) C13d-03/18

In sugar bearing plants, the diffusion juice is purified by heating it and passing d.c. using soluble anodes.

This method is improved by using an Al-Mf anode (10-25% Mg); the electricity consumption is 2800-3500 A.h/m^3. By this method, the filtration properties of the juice are improved; a dense ppte. is formed, magnesium depassivates the anode. The purificn. degree is enhanced. The yield of sugar is increased, because of the decreased amt. of molasses.

MEYH- ★ D17 61444B/33 ★US 4162-925
Phosphated locust bean gum soluble in cold water - useful in gels with xanthan gum for foods, explosives, oil well slurries, agricultural applications, etc.
MEYHALL CHEMICAL AG 10.05.78-US-904689
A11 C03 H01 (31.07.79) C08l-05

Phosphated locust bean gum having a degree of substitution of 0.03-0.5 is new. The gum pref. has a degree of substitution of 0.07-0.1. Combinations of 50-90% of the gum with 50-10% xanthan gum are esp. pref., partic. 70-80% and 30-20% compsns. Xanthan gums are described in U.S. 3557016 and 4038206.

The phosphated gum is obtd. by treating the gum with an alkali metal phosphate, e.g. obtd. from aq. NaOH and H_3PO_4 to pH 6-7. Typically 100 pts. gum is treated with 4-20 pts. NaOH and 6-30 pts. H_3PO_4 in soln. at pH 6-7, esp. with 10 pts. NaOH and 14.7pts. H_3PO_4. A mixt. of NaH_2PO_4 and Na_2HPO_4 in the molar ratio 2:1-1:2 may also be used; 8-40 pts. mixt. being used per 100 pts. gum. Usually 20-100 pts. water is present per 100 pts. gum, with $\geqslant$20 pts. organic solvent per 100 pts. gum. Reaction is at 120-180°C for 0.5-4 hrs.

The gums in cold water form viscous sols; they may be combined with xanthan gums and the blends in cold water at 0.1-2% concn. form viscous gels without high shear agitation. The gels are thickeners and suspending agents in foods, explosives, oil well slurries, in agricultural applns. etc.; they are esp. useful for fluid drilling of pregerminated seeds to give accurate and precision spacing in soil furrows. 10.5.78 as 904689 (4pp1248)

*(31.07.79) *BE-873-390 B01d-01/18 + C13f-01*

Complex sugar solns. are dried to form a stable, solid, particulate prod. by (a) drying dispersed complex sugar solns. in a current of heated gas (inlet temp. = 100-300°C, outlet temp. = 60-120°C) and in the presence of 1-10 pts. wt. per pt. wt. solids in soln., of separately introduced recycled conditioned solids to produce a solid prod.; (b) contacting the prod. with a conditioning gas, having a humidity of $<$50% and having a temp. below the m. pt. of the formed solid, to reduce the water content of the solids to $\leqslant$ 0.5% and (c) recycling a portion of the conditioned solids to the drying zone.

Process gives a storage-stable prod. from mixed or complex sugar solns., e.g. high fructose corn syrup. Prod. density can be controlled. 11.1.78 as 868661 (5pp992)

MORF/ ★ D17 61445B/33 ★US 4162-927
Apparatus for crystallising sugar - both from solution and mother liquors, continuously by evaporation
MORFIN-ALVAREZ R 13.11.72-MX-139691
(31.07.79) B01d-09/02 C13f-01/02

Sugar is continuously crystallized by evaporating a highly concentrated mass of liquid under a vacuum. The process is carried out in an appts. which comprises a hollow cylindrical vessel having a slot extending completely along its upper wall. A rectangular cover is positioned over the slot and acts as a vapour chamber. A shaft with radial paddles exerts a helicoidal movement to the liquid in the vessel.

Liquid may be added to control the concn. of the liquid through distributor pipes which extend through the cover at regularly spaced intervals. Elbow couplings are connected to the distribution tubes and to these reduction tubes are connected which extend perpendicular to the central axis of the vessel. Sight holes are spaced along the cover in line with the reduction tubes. The level to which the vessel is filled is regulated by a sliding barrier near the discharge end of the vessel.

The appts. may be used to continuously crystallize by evaporation both sugar solns. and mother liquors. The two different processes of crystallization can be carried out in a single appts. 11.5.77 as 795833 (+ 25.8.75 - US - 607730) (9pp295)

Dental filling resin compsn. - contg. bisphenol A and low molecular aliphatic epoxide resins, bactericide, hardener and filler

RYBAKOV A I 14.09.67-SU-185724

A96 (A21) (18.05.77) A61k-05/06

The compsn used in stomatology, as tooth filling comprises (in wt.%): epoxy-bisphenol A resin (I), 38.38-46.67; low molecular aliphatic epoxide resin (II), e.g. glycidol, monoethylene-glycol stearate ester (III) 19.19-11.72; bactericidal agent, e.g. decamine, 1.91-4.0, hardener, e.g. 1-β-amino-ethyl-2-alkyl-imidazoline 21.38-5.86 and X-ray contrast medium, e.g. barium sulphate, as filler is the rest.

The compsn. has improved plasticity and improved hardening characteristics in the canal of the tooth. Rybakov A.I., Blyakhman E.M., Ivanov V.S., Bul. 9/5.3.77 14.9.67 as 185724 (2pp938)

HENK D21 48185A/27 =US 4162-893

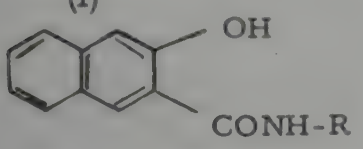
Dyeing keratin materials, esp. hair, with developed dyes - using N-aryl-2-hydroxy-naphthalene-3-carboxamide as coupling component

HENKEL KG AUF AKTIEN (CIBA) 27.12.76-CH-016349

*E21 (31.07.79) *DT2757-866 A61k-07/13*

Human hair is dyed with developing dyes by applying an effective amt. of aq. solns. of diazo salts and coupling components to the hair at 15-40°C. Diazo salts and coupling components are applied either successively in any desired sequence, or simultaneously.

(I)



The coupling component is a 2-hydroxy-naphthalene 3-carboxylic acid amide of formula (I), such that R is substd.- or unsubstd. aryl gp. Pref. R is Ph, alpha- or beta-naphthyl, unsub-std. by lower alkyl, lower alkoxy, halogen or nitro gps., or their mixts., or substd. by Ph which is unsubstd. or substd. by lower alkyl, lower alkoxy, halogen or nitro gps., or their mixts., or substd. by a biphenyl cpd.

The compsns. are esp. suitable for shading or dyeing; and also for overdyeing human hair. Dyes display fastness to washing, cold setting, rubbing, light and perspiration, possiblity of turning dye hair blonde, absorption of the components w.r.t. damaged hair and behavious w.r.t. permanent waving. 21.12.77 as 862696 (7pp931)

Compsn. active against erythema solare comprises a synergistic mixt. of tinctures of Apis mellifica at a dilution of 4°CH to 15°CH (pref. 7°CH) and Calendula at a dilution of from a third decimal to 9°CH(pref. 4°). Pref. a glossette contains dilutions of Apis mellifica and Calendula in equal pts. wt. in an excipient. Pref. the glossettes are used in prophylactic treatment of erythema solare.

The compsn. may also be used in the form of a cream or ointment for cutaneous treatments. Other oral forms are lozenges, pills, drops, pellets, syrup or ampoules. 6.5.77 as 794588 (5pp924)

PLAS- ★ D21 61519B/33 ★US 4163-092

Cationic hydrogels based on hydroxyalkyl acrylate and methacrylate - prodn. are useful as anion exchangers and for combining with, e.g. biologically active materials to provide slow material release

PLASTOMEDICAL SCI 18.08.77-US-825521 (11.02.75-US-549096)

A14 B07 C03 (A91 A96) (31.07.79) C08f-220/06

Cationic, polymeric hydrogels are produced by simultaneously polymerising and crosslinking, in the presence of a free radical polymerisation catalyst in an amt. of 0.05-4 wt.%, based on the total wt. of monomers, and at 20-125°C, a mixture of monomers.

The monomer mixt. comprises (a) 40-95 wt.% of an acrylic monomer selected from glyceryl monoacrylates and monomethacrylates and acrylic cpds. of formula $CH_2=C(R)-CO\{O-CH_2-CH(R')\}_n OH$ (where R and R' are each H or 1-6C alkyl; and n is 1-50); (b) 50-0.05 wt.% of a quaternary ammonium cpd. of formula $CH_2=C(R)-CO-O-CH_2-CH(OH)-CH_2-\overset{+}{N}(R^2)(R^3)(R^4)Y^-$ (where R is H or CH_3; R^{2-4} are each (ar)alkyl or phenyl; and Y is an anion); (c) 0.2-12 wt.% of a crosslinking agent of formula $CH_2-C(R)-COO-A-OOC-C(R)=CH_2$ (where R is H or 1-4C alkyl; and A is 2-10C alkylene or a polyglycol other gp. of formula $\{CH_2-CH(R')-O\}_n CH_2-CH(R')-$, R' being H or (m)ethyl and n being 1-20), and (d) 0-50 wt.% of other monoethylenically unsatd. cpds. selected from acrylamides, methacrylamides, alkyl-acrylates and-methacrylates, N-vinyl lactams, N-vinyl succinimide, N-vinyl diglycoylimide, N-vinyl glutarimide, N-vinyl-3-morpholinone, N-vinyl-5-methyl-3-morpholinone and N-vinyl imidazole. Provisos are that (a) $\geq$ (d) and (a) + (d) = 40-95 wt.% and when an N-vinyl cpd. is used in (d) it is used in an amt. of $<$20 wt.%.

The hydrogels have good water permeability and mechanical properties, and are useful as anion exchangers and for combining with e.g. agricultural chemicals, pharmaceuticals and cosmetics. US 4060678 described a similar hydrogel prodn. process using a different quaternary ammonium cpd. (b). 18. 8. 77 as 825521 Div. ex4060678 (10pp990)

Antithrombotic polyamide prepn. - by reacting quaternary polyamide salt with antithrombotic cpd. having anionic gp. pref. heparin
UNITIKA KK 15.12.77-JA-151532
A96 P32 (A23) (02.07.79) A61f-01 C08g-69/48

Prepn. of antithrombus polyamide comprises reacting polyamide with an oligomer and/or polymer of ethyleneimine to obtain aminated polyamide, quaternizing the aminated polyamide and then reacting the resulting quaternary salt with an antithrombotic cpd. having an anionic gp. (e.g. heparin, chondroitin, homopolymer or copolymer of vinylsulphonic acid, styrenesulphonic acid, etc.) pref. heparin.

Antithrombus property can be imparted to polyamide simply and unexpensively. The resulting antithrombus polyamide is excellent in not only antithrombus property but also strength, mouldability etc. as required as high polymer material for medical use.

The reaction between polyamide and polyethyleneimine is conducted in a solvent at -20-250°C for 10 min-24 hrs., if necessary using a dehydrated condensating agent. Quaternisation of aminated polyamide is conducted using a known quaternising agent, e.g. hydrogen halides or halogenated hydrocarbons, at 0-90°C for 1-24 hrs. The quaternised polyamide is then contacted with an aq. soln. of the quaternised polyamide (pref. at a concn. of 0.01-10 wt.%, more pref. 0.5-5 wt.%) at 10-100°C, pref. 30-90°C. 15.12.77 as 151532 (4pp140)

TEIQ ★ D22 60513B/33 ★J5 4084-004
Wood preservation process - comprises supplying inert gas atmos., fumigating under reduced pressure, then opt. desorbing the fumigant
TEIJIN CHEMICALS KK (HITF) 13.12.77-JA-148748
C03 E16 F09 P63 (E13) (04.07.79) B27k-03/02

The method comprises (a) laying wood material in a closed vessel, (b) replacing the air in the vessel with inert gas, (c) fumigating the wood under reduced pressure and (d) opt. desorbing the fumigant adsorbed on the wood by a combination of treatment under reduced pressure and steam-heating. The treatment stages (b), (c) and (d) give a synergic effect and the wood can be effectively fumigated economically and safely in a short time. By replacing the air in the vessel with inactive gas and effecting the fumigation under reduced pressure, the adsorption of the fumigant on wood material can be decreased and the insecticidal effect is high. Further by desorbing the fumigant by steam-heating under reduced pressure, the fumigant can be desorbed forcibly and the fumigating time can be shortened without giving harmful effect. As fumigant, methyl bromide, chloropicrin, ethylene dibromide, etc. can be used and they are used ca. 200 g on 1 m^3 of the vessel volume. The fumigation is effected under a pressure of ca. 50 Torr for 2 hrs. 13. 12. 77 as 148748 (3pp5)

TEIQ ★ D22 60514B/33 ★J5 4084-005
Wood fumigation - by wetting wood, placing it in closed vessel, fumigating under reduced pressure and opt. desorbing fumigant
TEIJIN CHEMICALS KK (HITF) 13.12.77-JA-148749
C03 E16 F09 P63 (E13) (04.07.79) B27k-03/02

The method comprises (a) wetting the wood, (b) putting it in a closed vessel, (c) fumigating it under reduced pressure and (d) if necessary, desorbing the fumigant adsorbed on it by combining the treatment under reduced pressure and steam-heating.

Water on the pores, in which insect is alive, is removed. The remaining parts are water-sealed and the fumigant rapidly permeates the pores concentrically. The adsorption of fumigant on other parts can be decreased and the adsorbed fumigant can be easily desorbed in a short time without a redn. in the wood quality.

Methyl bromide, chloropicrin, ethylene dibromide, etc. are pref. used as the fumigant, being almost insoluble in water, they are hardly adsorbed on the wet wood. The fumigant is pref. used in an amt. of 75-200 g per m^3 of the vessel volume, and fumigation occurs under a reduced pressure of ca. 50 Torr for 1-4 hours. 13. 12. 77 as 148749 (4pp5)

TEIQ ★ D22 60515B/33 ★J5 4084-006
Wood fumigation method - where fumigant is desorbed from wood by using reduced pressure and steam heating
TEIJIN CHEMICALS KK (HITF) 13.12.77-JA-148750
C03 E19 F09 P63 (E36) (04.07.79) B27k-03/02

In a wood fumigation method the fumigant is desorbed from the wood material, which is previously fumigated using fumigant in high concn., in a closed vessel by combining the treatment under reduced pressure and steam-heating.

Pref. a pre-desorbing treatment is previously applied to the fumigated wood by repeated redn. of pressure and the restoration of pressure to atmospheric pressure in the vessel, to promote the desorption.

As fumigant methyl bromide, chloropicrin, ethylene dibromide, hydrogen phosphide, etc. can be used and usually the fumigation is prcticed under reduced pressure or normal pressure in a vessel using fumigant 200-500 g on 1 m^3 of the vessel volume for 2 hours. After the fumigation remaining gas is discharged to reduce pressure of 50-100 Torr using a vacuum pump and the steam of $>$120C is introduced for 5-20 minutes.

Adsorbed fumigant can be effectively desorbed in a short time without reducing the wood quality. 13. 12. 77 as 148750 (3pp5)

TEIQ ★ D22 60516B/33 ★J5 4084-007
Fumigating wood - involves wetting the surface of the wood and fumigating under reduced pressure combined with steam heating for desorption of fumigant
TEIJIN CHEMICALS KK (HITF) 13.12.77-JA-148751
C03 E16 F09 P63 (E13) (04.07.79) B27k-03/02

Method comprises (a) laying wood in a closed vessel, (b) wetting the surface of the wood either by sprinkling water on it or by immersing it in water, (c) replacing the air in the vessel with inert gas, (d) fumigating under reduced pressure and (e) desorbing the fumigant adsorbed on it by combining the treatment under reduced pressure with steam-heating.

Fumigation and desorption of fumigant can be practiced efficiently in a short time without decreasing wood quality.

The fumigant is permeated concentrically in the pores, in which insects are alive, and the amt. of the fumigant adsorbed on the other parts is decreased. The fumigant may be methyl bromide, chloropicrin, ethylene dibromide, etc. and the fumigation is practiced under a reduced pressure of 30-200 torr using 200-500 g fumigant per m^3 of vessel volume. 13. 12. 77 as 148751 (3pp5)

OHSH- ★ D22 60517B/33 ★J5 4084-008
Bleaching method for wood, board etc. - using soln. contg. hydrogen peroxide and chlorite
OHSHIKA SHINKO KK (ENDO-) 13.12.77-JA-148881
C03 E36 F09 P63 (04.07.79) B27k-05/02

Bleaching of wood, thick board or rectangular timber comprises immersing wood in a bleaching soln. contg. H_2O_2 2-15 wt. % and chlorite 1-13 wt. % (where the chlorite concn. should be lower than H_2O_2 concn.) and heating it under reduced pressure.

Wood can be bleached while keeping good contrast between spring autumn woods and by heating the wood in the bleaching soln. under reduced pressure, the bleaching can be practiced uniformly to as deep as ca. 20 cm. By controlling the bleaching conditions, the degree of contrast, the bleaching degree, the bleaching depth, etc. can be regulated freely. 13. 12. 77 as 148881 (4pp5)

Sanitary napkin for feminine hygiene - having menstrual blood absorbing and capturing layer contg. gums and sodium pectinate
HASHIMOTO J 17.12.77-JA-152143
A96 P32 (05.07.79) A61f-13/18

A sanitary napkin is provided with a menstrual-blood-absorbing- and-capturing layer consisting essentially of tragacanth gum (of pectinase, soluble rubber, cellulose, starch and so on), guayule gum (of galactose and mannose) and sodium pectinate.

The sanitary napkin suitably comprises a laminate of an absorption layer of absorbent cotton, a menstrual-blood-absorpting and-capturing layer of a number of craft papers contg. tragacanth gum, guayule gum, and sodium pectinate, and a second absorption material layer of paper cotton, a water-repellent cover layer of a water-reppellent paper surrounding the laminate with an opening to expose the absorption material, and a coat of an unwoven cloth.

Menstrual blood is absorbed through the unwoven cloth oat and the absorption layer into the blood-capturing layer n which the blood is rendered sticky, and the blood leak- ge is prevented. 17.12.77 as 152143 (3pp30)

NIRA ★ D22 60576B/33 ★ J5 4084-397

Anticoagulative material for artificial heart, kidney etc. - comprising a high mol. material e.g. polymer on which an aminoacid is bound or absorbed

UNITIKA KK 15.12.77-JA-151533

A96 P34 (05.07.79) A61l-17 A61m-01/03 A61m-25 C08f-08/32 C08g-85

Anticoagulative material consists of a high mol. material to which an amino acid is boulo or absorbed. The amino acid is pref. an alpha-amino acid e.g. leucine, phenyl alanine, tyrosine, isoleucine, alanine, valine, serine, threonine, glycine, asparagine, glutamine, arginine, proline or lysine. The high mol. material is e.g. organic such as polyamide, polyester, PVC, polystyrene, polyurethane, polycarbonate, polyacryl amide, polymethacrylate, polyethylene, polypropylene, PVA, silicone resin, cellulose, starch, or natural rubber, or inorganic such as glass, asbestos, mica, or additive carbon.

Amino acid is found to give an excellent anti-blood-coagulation property over long usage, and it is advantageously used in place of a conventional anti-coagulant heparin. The anticoagulative material is used for an artificial heart, kidney, lung, or blood vessel. 15.12.77 as 151533 (5pp30)

NIRA ★ D22 60577B/33 ★ J5 4084-398

Imparting antithrombotic nature to medical material - by reacting poly:amine with reagent contg. amino reactive gps. on the material, and reacting with antithrombotic cpd., esp. heparin

UNITIKA KK 15.12.77-JA-151531

A96 P34 (05.07.79) A61l-17 A61m-01/03 A61m-25 C08g-73/04

Method comprises reacting a reagent, having ≥ 2 functional groups reactive with amino groups, and excess polyamine, on the surface of a solid material to form a film, making the unreacted amino group in the film into a fourth-class chloride, and then reacting the film with an antithrombotic cpd. having an anionic gp.

The polyamine is pref. polyethyleneimine. The solid material is e.g. of glass, natural rubber, cellulose, polystyrene, polyamide, polyester, silicone, polyurethane, PVA or PVC. The reagent is e.g. of glutaric aldehyde, terephthalic aldehyde, isophthalic aldehyde, hexamethylene-di-isocyanate, polyepoxide, anhydride polycarboxylate etc. The chlorination is carried out e.g. using HCl. 15.12.77 as 151531 (4pp30)

NICA ★ D22 60667B/33 ★ J5 4084-863

Deodoriser for treating malodorous polymerising ester(s) - e.g. vinyl acetate or acrylate cpd(s). in gas or liq. phase, contains hydrazine as effective component

NIPPON CARBIDE KOGY KK 19.12.77-JA-151644

A41 E36 (06.07.79) B01d-53/34 C02c-05/02

The deodoriser is useful for acrylates such as methyl acrylate, ethyl acrylate, butyl acrylate, 2-ethyl-hexylacrylate, hydroxyethyl acrylate, etc., methacrylates such as methyl methacrylate, ethyl methacrylate, butyl methacrylate, 2-ethyl-hexyl methacrylate, etc., vinyl esters such as vinyl acetate, vinyl propionate, etc. and polymerising monomers contg. double bonds, such as fumarates, maleates, etc.

When the polymerising esters are in a gas phase, the gas is contacted with the hydrazine aq. soln. in an absorbing tower, and when the esters are in a liq. phase, the hydrazine aq. soln. (pref. 5-25%) is added to the liq. and the mixt. is kept at 40-60°C. 19.12.77 as 151644 (2pp55)

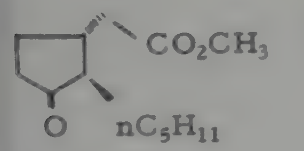
repn. of dihydrojasmonic acid methyl and dl jasmonic acid methyl
- used in perfume compsns. as jasmine oil components

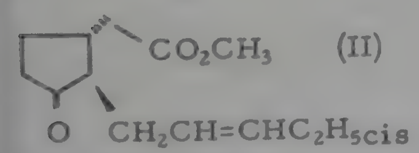
SHIONO KORYO KK 22.01.76-JA-006533

*E15 (23.07.79) *J52089-657 C07c-67/30 C07c-69/95 C07d-311/94 + C25b-03/02*

Prepn. of dihydrojasmonic acid methyl (I) and di-jasmon-
ic acid (II) is claimed.



(I)



(II)

3-Methoxycarbonyl-2-carbonyl norborane is electrolytically oxidised to give exo-2-acetoxy anti-7-methoxycarbon-ylnorbornane, Hydrolysis with sodium methoxide gives 7-methoxycarbonyl-2-hydroxy-norbornane. Oxidn. with chromic acid gives the corresp. 2-carbonyl cpd. and further oxidn. (with per acid e.g. monoperphthalic acid for days) gives 8-meth
oxycarbonyl-3-oxo-2-oxabicyclo [3, 2, 1]-octane. Hydro-
lysis (KOH/CH_3OH) and methylation (e.g. diazo methane)
yield 2-methoxycarbonyl-3-methoxycarbonyl methyl-
cyclopentanol. Treatment with chromic acid yields the
corresp. cpds. pentonone. Th is alkylated with n-pentyl-
bromide or 2-pentyl-bromide to give 2-methoxycarbonyl-
2-pentyl-3-methoxy-carbonyl-methylcyclopentanone (III)
and 2-methoxycarbonyl-2-(2^1-pentynyl)-3-methoxy-car-
bonylmethyl-cyclopentanone (IV).

(III) on decarboxylation (in dimethylsulphoxide at 180
°C) gives (I). (IV) is first cis-hydrogenated (Lindlar cat-
alyst) to give 2-methoxycarbonyl-2-(2^1-pentenyl)-3-meth-
oxycarbonyl-methylcyclopentanone which on decarboxy-
lation gives (II).

Jasmonic acid methyl is an important constituent in
jasmine oil used in perfumes (I) and (II) are obtd. in good
yield. 22. 1. 76 as 006533 C07c-69/95, 69/30, C07d-311/94

Effluent gases from a polychoroisocyanurate prodn. process are analysed for NCl_3 by (a) forming a gaseous mixture by introducing the effluent gases and a carrier gas into a first zone, (b) passing the mixture from this zone through a chromatographic column to separate the NCl_3 from the mixture, (c) passing the NCl_3 from the column to a detector or so that its concn. can be measured, (d) recording the concn. of NCl_3 on e.g. a meter, (e) providing the meter with an upper limit for the NCl_3 concn. in the effluent gases, and (f) activating an alarm when this upper limit is reached or exceeded. Pref. the chromatographic column contains PTFE powder coated by a silicone oil.

The process avoids the presence of explosive amounts of by-product NCl_3. US 4087607 described a continuous polychloroisocyanurate prodn. method employing the NCl_3 analysis process. The polychloroisocyanurates are useful in washing, bleaching and sanitising applications.

Recovering traces of platinum gp. metals from waste solns. - by anodic oxidn., cathodic redn., and repeated anodic oxidn.

MATTHEY RUSTENBURG 13.07.76-GB-029093

*M28 (31.07.79) *DT2731-698 C25c-01/20*

Pt Gp. metal, present as a stable complex dissolved in an aq. effluent from a Pt Gp metals refinery, is recovered by (a) adjusting the pH to $\geqslant 10$; (b) heating to $> 60\,°C$; (c) electrolysing using an anode potential having a half-cell voltage of $\geqslant 7.5$ volts and a current density $\geqslant 0.2 A/cm^2$; and (d) filtering off the pptd. metal.

Pref. the electrolysis is effected using a graphite electrode. Spectrographic examination of the residue shows a max. of < 1 ppm of total metals in the treated electrolyte. 15.9.78 as 942814 C.i.p. 4127458 (+ 12.7.77 - US - 815005) (3pp936)

Body imparting fabric treating compsn. - contg. alkali-treated starch and surfactant

PROCTER & GAMBLE CO 13.03.78-US-885925

(31.07.79) D06m-13

Liq. compsn. for restoring body to fabrics contains (a) 1-25% gelatinised stabilised vegetable starch, prepd. by treating starch in water dispersion at pH 10-13, then neutralising to pH 4-9; (b) 5-50% anionic, nonionic, zwitterionic and/or amphoteric surfactants; (c) $\leqslant 20\%$ electrolyte and (d) 25-94% water.

Compsn. is stable, and not prone to retrogradation. It removes traces left after treatment of the fabric with water insoluble solvents. 13.3.78 as 885925(6pp955)

PROC ★ D25 61478B/33 ★US 4162-987

Enzyme-contg. automatic dishwashing detergent compsns. - contg. mixt. of proteolytic and amylolytic enzymes

PROCTER & GAMBLE CO 16.01.78-US-869881 (24.06.76-US-699416)

A97 (D16) (31.07.79) C11d-03/37

Cleaning compsn. esp. for automatic dishwashers contains: (a) 0.5-20% of an alkoxylated nonionic surface active agent (I); (b) 0.001-5% of an enzyme mixt. of a proteolytic enzyme (II) (proteolytic activity 80-100% of max. activity when measured at pH 12 using Anson Haemoglobin method in presence of urea) and an amyloytic enzyme (III) (amylolytic activity $> 50\%$ of max. when measured at pH 8 by the SKB method at 37°) in ratio 4-1:1-4; (c) 0-5% of a suds regulating agent (IV); (d) 0-60% of a detergent builder (V); and (e) 0-20% H_2O. The final compsn. has amylolytic activity $\nless 150$ Kilo Novo units/kg, and proteolytic activity $\nless 6.0$ Anson units/kg.

(I) is (i) the condensn. prod. of a 10-18C carboxylic acid (1 mol) with ethylene oxide (EO)(5-50 mol); (ii) the condensn. prod. of a 10-24C alcohol (1 mol) with 5-50 mol. of (EO); (iii) polyethylene glycols of mol. wt. 1400-30,000; (iv) the condensn. prod. of alkylphenols (8-18C alkyl)(1 mol) with 4-50 mol. (EO); (v) the condensn. prod. of $PhCH_2Cl$ and an ethoxylated alkylphenol (6-12C alkyl; 12-20 mol. (EO) condensed/mol. alkylphenol); (vi) $(ClC_6H_4)_2CHCO_2(CH_2CH_2O)_xR$ (where x = 4-20; R=1-4C alkyl); (vii) $Y[(C_3H_6O)_n(C_2H_4O)_mH]_x$ (where Y is 1-18C organic radical contg. x reactive H atoms; n and m are such that the (C_2H_4O) content is 10-90% by wt.); (viii) the alkoxylated nonionic surface active agents of formula (i)-(vii) in which the terminal OH of the alkoxy grp. is acylated with a monobasic acid; (ix) or mixts.

(IV) is (i) $\{SiRR'O\}_x$ (x=20-2000; RR'=Me, Et, Pr, Bu, or Ph); (ii) a microcrystalline wax of m.pt. 35-115° and saponification value < 100; (iii) stearyl or oleyl acid phosphate; (iv) a siloxane/glycol copolymer self-emulsifying suds suppressor; or (v) mixts. (V) is Na or K polyphosphate, carbonate, bicarbonate, alkali silicates, polyacetates, carboxylates, polycarboxylates, polyhydroxysulphonates, or mixts.

Compsns. are free of active Cl, and give improved cleaning performances for a range of soils compared with compsns. contg. conventional enzymes. In addn. the compsns. provide excellent dish-washing properties even though phosphate levels may be reduced or sero, and the tendency for the enzymes to be inactivated is reduced. 16.1.78 as 869881 (11pp478)

UNIL ★ D25 61483B/33 ★US 4162-994

Mechanically mixed, non-spray dried powdered detergent compsns. - contg. calcium salt of anionic surfactant, ethoxylated nonionic surfactant, builder salt and calcium carbonate

LEVER BROTHERS COM 10.11.77-US-850320
(31.07.79) C11d-01/83 C11d-03/06

Powdered laundry detergent compsn. contains: (a) 4-20 wt. % of the Ca salt of a non-soap organic anionic surfactant (I); (b) 4-20 wt. % of an ethoxylate of alcohol nonionic surfactant (II); (c) 5-70 wt. % of an alkali metal salt of a builder cpd. (III) that pptes hardness ions in H_2O; and (c) 0-40 wt. % of $CaCO_3$ as a crystallisation seed.

Use of the Ca salts of (I) gives detergent compsns. which possess good processing and detergency characteristics, and excellent cold H_2O detergency performance.

CPI INDEXES

ALERTING PATENTEE INDEX (II)

Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX I

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240	
PCT	40	
Research Disclosure	20	
South Africa	100	
Sweden	260	
United Kingdom unexamined	600	3325

Slow publishing

Canada	450

Japan examined	340*	
Netherlands examined	60	
Soviet Union	1200	
Switzerland	260	
United Kingdom examined	300	
United States	1200	4375

*Only CPI coverage for Japan.

"Minor" Countries

Complete coverage, but only introduced during 1975, with exception of Italy 1978.

Fast publishing

Brazil	140	
Denmark	120	
Finland	60	
Norway	80	
Portugal	30	430

Slow publishing

Austria	125	
Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

D1: FOOD; FERMENTATION

D11: BAKING

SHIM- ★ D11 62106B/34 ★J5 4086-641
Noodles prodn. - includes adding water to opt. crushed rice, grinding in presence of water, adding wheat flour to emulsion and forming noodles
SHIMADA-YA HONTEN K 19.12.77-JA-152693
(10.07.79) A23l-01/16

Prodn. of noodles comprises (1) addn. of water to rice (I) or crushed rice (II) for absorption of water into (I) or (II), (2) grinding (I) or (II) in the presence of water in amt. more than double the weight of (I) or (II), (3) addn. of the resulting emulsion to wheat flour, so that the wt. of (I) or (II) is 1-50 wt. % of the weight of wheat flour and (4) prodn. of noodles by the usual method.

Pref. α-amylase, cellulase, hemicellulase, protease, acid or alkali, such as phytic acid, acetic acid, lactic acid, citric acid, sodium carbonate, potassium hydroxide, etc., glycine, ethyl alcohol, propylene glycol are added as required in step (2), for improvement of texture.

Noodles of texture as good as that produced only from wheat flour are obtd. 19. 12. 77 as 152693 (4pp42)

KIFO= ★ D11 62666B/34 ★SU -632-334
Tunnel type baking oven - has a combustion chamber in steaming section below the working branch of conveyor hearth
KIEV FOOD IND TECH 07.02.77-SU-452169
(16.11.78) A21b-01/28 A21b-03/04

Reduced aerodynamic resistance in the circulation system of the heating gas, simplified design and lower metal content of the tunnel-type baking oven are due to the steaming chamber. The latter is set below the working branch of the conveyor hearth.

The heating gases from the combustion chamber are fed to the top and bottom headers, and after passing the gas heating ducts they enter the outlet header. The blower draws the gases through the collecting duct and feeds them to mixing chamber of the firebox with part of the gases exhausted into the atmosphere. Mikhelev, A.A., Sigal, M.N., Shulgin, I.M. et al. Bul. 42/15.11.78. 7.2.77 as 452169 (2pp89)

SVBA- ★ D11 B/34 ★SW 7800-121
Electrically heated bread-baking oven - with its bottom plate laid on supports resting on, but not fixed to, the heating elements
SVENSKA BAKUGNSFABR 04.01.78-SW-000121
(06.08.79) A21b-01/50

The oven is heated by electric elements, some of which are positioned below the bottom plate of the oven chamber. The bottom of the oven is formed by one or more plates which can be raised for removal.

The plates rest on supports which are not permanently fixed but placed on the electric elements so that they can be easily moved. The positions of the supports can be varied by moving them, removing some or adding additional supports. 4. 1. 78 as 000121 (-pp1183)

CALL/ ★ D11 63087B/34 ★US 4163-806
Unbaked cheese cake made from cream cheese - mixed with powdered sugar and non-dairy whipped topping, and refrigerated until firm
CALLEN D M 21.04.77-US-789685
(07.08.79) A23c-19/12

An unbaked cheesecake is formed from a mixt. of cream cheese, 10-25% w/w of non-dairy whipped topping and 15-40% w/w sugar. The mixt. is refrigerated until firm, pref. after placing in an edible shell. Pref. the topping concentration is 18-28% and the sugar concentration is also 18-28%.

The cheesecake is prepd. by mixing the ingredients without the necessity of a baking step. 21. 4. 74 as 789685 (2pp)

D12: MEAT; FISH PROCESSING

RASC/ ★ D12 B/34 ★CS 7803-364
Peelable collagen coatings and cellulose sheets
RASCHIK P 24.05.78-CS-003364
G02 (31.05.79) A22c-13

HENR/ ★ D12 B/34 ★DK 7800-098
Slaughtered poultry processing plant
HENRIKSEN J 10.01.78-DK-000098
(30.07.79) A22c

KOMA/ ★ D12 62114B/34 ★J5 4086-655
Mfg. sweet boiled carp contg. honey - by adding honey at less than 80 degrees C and impregnating in carp meat
KOMATSU Y 20.12.77-JA-153817
(10.07.79) A23l-01/32

Honey-boiled carp can be prepared while preventing the browning of carp meat, and the method comprises adding honey at the temp. where levulose in honey does not take part in amino-carbonyl reaction and impregnating honey in carp meat. Pref. the honey is not heated to > 80 °C.

Sweet boiled carp is delicious and is free of the muddy odour specific to carps, can be taken with bone and all, and has been prepared using 'sake', 'syoyu', sugar, etc. as seasoning. Honey is used in addition to above seasonings and with it nutritive value and glossiness of the sweet boiled carp can be increased. 20. 12. 77 as 153817(2pp5)

TAKA/ ★ D12 62509B/34 ★J5 4089-060
Colour-stabilising treatment for eggs, meat and fish - using edible salt and ammonium salt(s)
TAKAGI M 27.12.77-JA-156722
E35 (14.07.79) A23l-01/27

Method comprises processing egg and meat of marine and ground animal using edible salt and $\geqslant 1$ ammonium salt(s). Usually the ammonium salts are combined 0.01-2.0 w/w% on starting material. Ammonium alum shows the remarkable improving effect on the texture of egg and meat and for the object it is used 0.02-1.0 w/w% on the starting material.

Ammonium salt shows a remarkable preventive effect on the darkening of haemoglobin, myoglobin and blood vessel due to oxidn., the clarifying effect on blood vessel and the preventive effect on the greening of bilirubin due to oxidn. Further some ammonium salts also show the improving effect on the texture of egg and meat. 27. 12. 77 as 156722 (2pp5)

UENS ★ D12 62510B/34 ★J5 4089-061
Quality improving agent for minced fish meat - comprises glycerine fatty acid ester with mono:ester content of 40-55 per cent
UENO SEIYAKU OYO KE 27.12.77-JA-156358
E17 (14.07.79) A23l-01/32

The agent contains a glycerine fatty acid ester having mon

-oester content 40-55% pref. 50% and opt. oil and fat as effective ingredients. The agent improves the whiteness of minced fish meat remarkably and freeze-denaturation of the protein in minced fish meat during its preservation can be prevented. Boiled fish paste prepd. from the treated minced fish meat has excellent elasticity and texture.

Pref. the glycerine fatty acid comprises, in addn. to the monoester, mainly diester, and a small amt. of triester. By combining oil and fat such as cotton seed oil, linseed oil, soy bean oil, tallow, lard, etc. the whiteness of frozen minced fish meat can be further improved.
27.12.77 as 156358 (7pp5)

MIPR= ★ D12 62667B/34 ★SU -632-335
Livestock carcass cutter - has a pneumatic hammer striking the pivoted blade connected by a spring
MINSK PRODMASH WORK 29.04.77-SU-483381
(15.11.78) A22b-07

Animal carcass chopper of enhanced efficiency has a hatchet with a pneumatic striker articulated to it at one end. The other end is connected by a spring. During carcass splitting, the striker imparts reciprocation to the blade around the pivot, while the cutting edge is also moving along the striker axis.

The mechanism ensures a simultaneous cutting and chopping action on the carcasses, accelerating the dividing of the carcasses. It also prolongs the service life of the blade.
Dubinskii, L.R., Chaikovskii, A.A., Soloveichik, S.L.
Bul. 42/15.11.78. 29.4.77 as 483381 (2pp89)

FISH= ★ D12 62668B/34 ★SU -632-336
Smoked fish head remover - features helical cutting blades with inclination proportional to fish head size
FISHING FLEET DES 03.03.77-SU-459557
(20.11.78) A22c-25/10

Reduced force required for removing spiked sprats head and prevention of bending the fish are ensured by cranked plate knives which are connected at the end by discs. The cutting edges are set along a helical line with a lead angle of tan $\varphi = 2a/b$, where a is the pitch of fish spacing on spikes, and b is the distance between the eyes and the front of the fish head.

Four blades are mounted on each cutter shaft, the latter spaced to provide a passage for the spikes with fishes. A guide places the spikes in recesses between the conveyor chains for smooth entry into the cutting zones. The heads are removed after smoking of the fishes.
Stolin, L.M., Mikhailov, G.V., Osovets, V.I. et al.
Bul. 42/15.11.78. 3.3.77 as 459551 Add. to 449705 (3pp 89)

MOMD ★ D12 62694B/34 ★SU -632-392
Cutter for meat grinder - has blades of wedge shape with an acute apex angle
MOSCOW MEAT DAIRY INST 10.02.77-SU-452186
P41 (30.09.78) A22c-17 B02c-18/36

Longer service life of the meat grinder is due to the plane of blade sharpening forming a wedge with an apex angle of 6-16°. The blade operates in combination with a stationary perforated disc with the edges of blade cutting off pieces of meat that are pushed through disc perforations.

The cutter can be used in fast grinders and can operate in steam with a fixed grid which is made in the form of a disc with open apertures.
Ivashov V.I., Yurkov S.G., Bubyrenko V.K. et al. Bul. 42/15.11.78 10.2.77 as 452186 (2pp89)

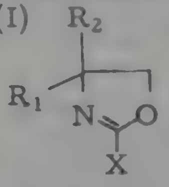
ALEX/ ★ D12 B/34 ★SW 7800-013
Cooling animal carcass - by fresh water shower after initial rapid cooling
ALEXANDERSON S 02.01.78-SW-000013
(06.08 79) A22b-07

Cooling of slaughtered animal carcasses is effected of first applying a rapid and powerful cooling process and then explosing the carcass to a fresh water shower of predetermined period at certain time intervals.
2.1.78 as 000013 (-pp1183)

TEEP D12 54569X/29 =US 4163-463
Sausage skin opt. reinforced by fibre - obtd. by adding fatty acid gp-substd. oxazoline wax to viscose before extrusion (BE060776)
TEE PAK INC 06.01.75-US-538636 (09.11.78-US-959396)
*A97 E13 +Q67 (07.08.79) *DT2600-203 +C08b-09 F16l-11/08*

An artificial sausage casing of regenerated cellulose is claimed, the cellulose being impregnated with 1-15wt.% of an oxazoline wax of formula (I).

(I)



In (I), X is $-CH_2R$ or $-CHR=CH_2$. R is 10-24C fatty acid radical. R_1 is methylol, 1-10C alkyl or a fatty acid ester radical of formula (fatty acid-C(O)-O-CH_2-) (II) with the fatty radical portion having 10-24C atoms and ≯1 unsatd. gp. R_2 is methylol, 1-20C alkyl or a radical (II). Pref. R is a stearic acid radical and $R_1=R_2$=stearic acid ester radicals.

The casing has excellent handle, flexibility and peelability from sausages processed in the casings. 9.11.78 as 959396 (6pp992)

SCHN/ ★ D12 B/34 ★ZA 7801-244
Sliced biltong and container - with air circulation system
SCHNEIDERMAN D 03.03.78-ZA-001244
P28 Q74 (14.05.79) A47j-43 F24f-03

Appts. for holding sliced biltong includes a receptacle and means for forcing air to circulate through the sliced biltong in the receptacle. 3.3.78 as001244 (8pp)

WHIT- ★ D12 63135B/34 ★ZA 7802-283
Curing fish to simulate smoked fish - by spraying raw fish with smoke extract and preservative salt in curing zone, and conditioning at controlled temp.
WHITE STEVENSON 22.04.77-GB-016902
(01.03.79) A23b-04

PROT- ★ D12 B/34 ★ZA 7804-116
Collecting blood sample from animals - by inserting sterilised self-piercing hollow instrument into artery or vein and conducting blood into container
PROTEAN HDGS LTD 19.07.78-ZA-004116
(19.06.79) A22b

Method comprises suspending a stunned animal, stripping a portion of the hide of the animal to expose an area adjacent a major artery or vein of the animal, inserting a sterilised self piercing hollow instrument through the exposed area into the vein or artery and conducting the blood in a sterile manner from the instrument to a container in which the blood is collected. 19.7.78 as 004116(23pp)

Fatty food for frying sauce prepn - contg. fat, phosphatide, protein material, and effective amt of ammonium salt
UNILEVER NV 18.09.74-NL-012329
*(16.08.79) *BE-833-575 A23d-05*

Cooking oils are improved by the addition of ammonium salts, esp. NH_4 adipate, (0.2-5 m-mole/100g). Citric acid and/or citrate; and/or glutamate and lactate may be added. The prods. are virtually water-free and contain only traces of phosphatides, proteinous materials and salts, with improved browning properties. 17.9.75 as 541507 (5pp047)

HONE ★ D13 61699B/34 ★DT 2828-582
Soft drink contains full milk - acidified with fruit juice and/or organic acid and stabilised with carob bean gum
HONEY BEE CORP 10.02.78-JA-014349 (10.02.78-JA-014348)
(16.08.79) A23c-09/10

Acidified milk beverage having pH 2.5-4.5 (3.4-3.6) contains (i) whole milk, (ii) ≥1 acidifier consisting of fruit juice, (I), and/or organic acid, (II), suitable for drinking, and (iii) carob bean gum as stabiliser, so as to maintain a stable emulsion free from small, separated, coagulated lumps. The beverage is prepd. by (1) dissolving carob bean gum in whole milk; (2) mixing an emulsion of milk obtd. in (1) with the acidifier(s) at 35-60 (40-50)°C and (3) homogenising, pref. in a Gauline homogeniser.

The carob bean gum prevents segregation or sepn. of milk fats. Use of whole milk improves nutritional- and calorific value. At prevailing pH, microbe dissemination is retarded and shelf-life is improved. 29.6.78 as 828582 (16pp200).

HUSQ- ★ D13 61730B/34 ★DT 2903-984
Protein-contg. food prodn. - by extruding food paste from tube transparent to microwaves and treating with microwaves to give intense central heating (NL 7.8.79)
HUSQVARNA AB 03.02.78-SW-001280
+R59 (16.08.79) A23j-03 A23l-01 B29f-03/08 H05b-09/06

A paste of the prod. is formed to an extrudable mass and this passes forwards through a pipe which is transparent to microwaves: the material is subjected to microwave treatment in a $TM\text{-}_{o21}$ transmitter; the material leaves in a solid state and is transported onwards. Pref. the microwave treatment in the transmitter is such that the max. heat intensity is developed at the centre of the cross-section of the extruded material and the min. at the periphery. The contact surface between the extruded material and the inner wall of the pipe is lubricated.

Used for the prodn. of paste-like prods. of meat, fish, eggs and other protein substances. The method enables the central part of the extruded material to be more intensely heated than the outer part, thus compensating for the different speeds of travel of the central (faster) and outer (slower) regions of the material. 2.2.79 as 903984 (14pp236).

GEOC- ★ D13 61756B/34 ★DT 2905-058
Fresh spice plant preservation - by adding alkali salt, glycol and/or sugar moistening agent at room temp. to given water-activity
GENERALE OCCIDENTAL 15.02.78-FR-004250
(16.08.79) A23b-07

Spice plants are preserved in fresh condition by adding, at ambient temp., sufficient moistening agent(s), (I), to set water-activity of mixt. below 90 (pref. 85-90). Pref. (I) are water-soluble alkali metal salts, alkylene glycols, glycols and/or sugar. (I) are esp. NaCl, 1,2-propylene glycol, glycerol, saccharose and sorbitol. The herb compsns. may also contain 0.1-20 (1-10) wt.% edible oil.

Herbs preserved are parsley, chervil, basil, chives, taraggon and mint. Fresh herb preservation takes place at room temp., without dehydration, heating, addn. of chemical preservatives or changes in acidity. Organoleptic qualities are preserved for a long time. 8.2.79 as 905058 (15pp200).

BATT ★ D13 61866B/34 ★EP ---3-717
Lactoyl-urea and n-methylol-lactoyl urea prepn. - for use as ruminant feedstuff additives
BATTELLE MEMORIAL 14.02.78-CH-001585
C02 (22.08.79) A23k-01/22 C07h-13/12
D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, SW).

(A) Prodn. of lactosyl urea (I) comprises condensing lactose and urea at 70-110°C in presence of an acid catalyst and water. The amt. of water is the minimum sufficient for the consistency of the reaction mixt. to remain fluid under stirring but also sufficiently firm for the mixt. to be poured onto a flat horizontal surface without flowing.

(B) Prodn. of N-methylol-lactosyl urea (II) comprises treating (I) with HCHO in aq. alkaline medium. The use of (II) as a ruminant feedstuff additive is also new.

(I) and (II) are nitrogen-supplying ruminant feedstuff additives. After removal of excess urea, (I) is obtd. in sufficiently high purity to improve the digestion and assimilation of cellulose and also to inhibit the loss of assimilable urea by conversion into NH_3. (II) is similar to (I) but has even better properties relating to the slow, progressive release of nitrogen.

Compared with previous prepn. of (I) at lower temp. in presence of larger amts. of water, the process gives (I) more rapidly and in high yield, and hence more cheaply. Typically 85% yield is obtd. after 2 hrs. at 110°C. (I) is also obtd. in high purity and in non-hygroscopic form. 26.1.79 as 810007

(F) ISR: US4066750; US3989846; GB1515280.

BOUR/ ★ D13 61871B/34 ★FR 2408-307
Stable homogeneous animal feedstuffs - contg. a liquid food by/product and a gelling agent
BOURDIN M 10.11.77-FR-035277
C03 (13.07.79) A23k-01

Animal feedstuffs are prepared by mixing ⩾1 substance, having a high water content and associated with a gelling agent, with a nutritive material under the form of a paste, powder or fine solid. The substance having a high water content is pref a by-product of the food industry, such as lactoserum or blood. The gelling agent is typically gelatine, an alginate or lactic ferment.

The feedstuffs are cheap to prepare, stable and homogeneous. 10.11.77 as 035277 (5pp520).

NEST D13 57506Y/33 =GB 1550-746
Aromatic spice extract used for food flavouring - obtd. by combining grinding vapours and double solvent extraction
SOC PROD NESTLE SA 09.03.76-CH-002896
*(22.08.79) *BE-851-107 A23l-01/22*

Prodn. of an aromatic spice extract from one batch of spice comprises (a) grinding the spice and collecting an aromatic fraction A consisting of gases given off during grinding, (b) treating the spice with an apolar organic solvent to give an aromatic fraction B contained in the solvent and (c) treating the spice with ⩾1 polar organic solvent to give an aromatic fraction C contained in the polar solvent.

Provisos are that (a) always precedes (b) or (b) + (c), step (a + b) always precedes step (c) or (b + c), step (b) always takes place between (a) and (c) when none of the steps are combined, and steps (a) and (c) are never combined. The combination of A, B and C constitute the aromatic spice extract. 7.2.77 as 004883(8pp992)

RALS D13 29049Y/16 =GB 1550-878
Modified protein filaments prodn. for aq. slurry - by heat coagulation then modifying acidity at moment of discharge
RALSTON PURINA CO 11.12.75-US-639721
*(22.08.79) *US4017-646 D01f-04 +D01d-05/26*

Protein fibres having pH ⩾6.0 are obtd. by (1) heating a confined, flowing stream of a fluid aq slurry of a proteinaceous material under a pressure and at a temp. sufficient to coagulate the protein and form filaments; (2) passing the resulting stream through a back pressure-creating orifice into a collecting zone; (3) confining the discharged stream within a total angle of 4-90°C while injecting a pH-increasing agent; then (4) sepg. the filaments from the rest of the slurry.

The pH-increasing agent is pref. aq Na_2CO_3 soln. which is esp. at 250°F. The proteinaceous material may be soy protein. The prod. is used in prod. of foodstuffs esp. for blending with meat. Formation of lumps is avoided and a prod. with uniform and optimum pH can be obtd. 13.12.76 as 051954(7pp945)

AMPO- D13 84367X/45 =GB 1550-884
Dried potato rice products - produced by shaping a dough contg. water, starch, binder and potato solids, predrying, treating with oil and drying
AMERICAN POTATO CO 21.04.75-US-569903
*(22.08.79) *NL7604-057 A23l-01/21*

Prodn. of dehydrated instant texturised potato rice comprises (a) producing a dough comprising 64-78 wt.% water and 36-22 wt.% solids (I), (b) forming the dough into rice or hashbrown sized pieces, (c) predrying to a moisture content of 30-60 wt.% in the presence of air heated to allow efficient drying but to avoid browning or puffing, (d) coating with edible fat or oil and (e) drying at above the gelatinisation temp. of starch to a moisture content of 7-8 wt.% to texturise the pieces.

(I) consists of 3-10 wt.% raw starch or film-forming protein prod., 1-5 wt.% binder, 1.5 wt.% flavouring and the balance instant dehydrated cooked intact potato
The water in the dough is at a temp. below the gelatinis
tion temp. of the raw starch.

The prod. is reconstitutable in hot water to form ri
like textured rice and potato dishes. 21.4.76 as 016173
(5pp992)

Easily soluble dried soybean milk prepn. - by mixing sodium case
with soybean milk and spray drying
HOUSE SHOKUHIN KOGY 23.12.77-JA-154332
(10.07.79) A23c-11 A23l-01/20

Prodn. of easily soluble dried soybean milk (I), compris
(a) mixing sodium casein (II) with soybean milk produced by usual method and (b) spray-drying the mixt. The amt. of (II) used is 3-20 wt. % on solid of (I). The particle size of (I) is adjusted to 30-100 meshes by controlling the con
itions of spray-drying or by granulation in fluidised bed system. By adjusting pH of the mixt. of soybean milk an
(II) to > 7.2 before spray-drying, (I) is dissolved in wate
more easily. The pH of the mixt. is adjusted by the add
of Na acetate, Na_2CO_3, $(NH_4)_2HPO_4$, Na_2HPO_4, etc.

(I) can be dissolved in water with agitation for short time. (I) is used as stabiliser of ice cream, soybean milk-drink, foaming agent of cakes, etc. 23.12.77 as 154332 (6pp42)

SANW- ★ D13 62108B/34 ★J5 4086-64
Decolourising soybeans - includes boiling under high pressure
further boiling in water contg. hydrogen peroxide and decomposin
latter with catalase source
SANWA YAKUHIN KK 20.12.77-JA-153404
(10.07.79) A23l-01/20

Method comprises (1) boiling soybean under high pressur
(2) further boiling it in water contg. 0.1-6.0% hydrogen peroxide at 40-100°C and pH < 8 for 1-30 mins. and (3) decomposing hydrogen peroxide to water using catalase-producing microorganisms such as Aspergillus oryzae an
Bacillus natto.

Soybean can thus be decolourised easily even in small scale process. Brown coloured old soybeans can also be decolourised effectively. 20.12.77 as 153404 (4pp42)

HOUS- ★ D13 62109B/34 ★J5 4086-64
Compsn. for mfg. tofu, i.e. soybean curd - contains heat-treate
and dried soybean milk of high solubility to boiling water
HOUSE SHOKUHIN KOGY 23.12.77-JA-154331
(10.07.79) A23l-01/20

(1) A composition (I) of raw material for Tofu (soybean curd), composed of heat-treated and dried soybean milk (II), having > 80% of solubility to boiling water, > 90% of degree (III) of dispersion in boiling water and > 20 of degree (IV) of heat-denaturation.

Prodn. of (I) comprises (i) addition of casein sodium(V)
to soybean milk, (ii) adjustment of pH to > 7.2, (iii) adjus
-ment of (IV) to > 20 and (iv) spray-drying of the mixture.
Tofu is produced by (a) mixing (I) and granular flocculant (VI), which dissolves in water during > 4 sec., (b) adding
the mixture in boiling water and (c) cooling it.

As (I) can be dissolved and dispersed in boiling water easily, production of Tofu is simplified. 23.12.77 as 154331 (10pp42)

HOKU- ★ D13 62110B/34 ★ J5 4086-650
Potato storage - by treating with sorbic acid, potassium sorbinate or benzoic acid to suppress sprouting, then keeping at 2-5 degrees C
HOKUREN NOGYO KYODO (DAIL) 21.12.77-JA-154202
E17 P12 (E14) (10.07.79) A01f-25 A23b-07/10

A method for storage of potatoes, comprises spraying or painting the surfaces with sorbic acid, potassium sorbinate or benzoic acid as sprout-suppresing agent, then storing it at 2-5°C.

When potatoes sprout, toxic cpds. are formed and quality of the potato lowers. Toxicity of the reagents used is low.

The reagents are dissolved in volatile solvent, such as ethanol, n-propanol, etc., or dispersed in water with the addn. of surface active agent, such as sorbitan fatty acid ester, etc., and the soln. or emulsion is sprayed or painted on. The reagents may also be mixed and grinded to fine powder and sprayed in the powder-state. 21.12.77 as 154202 (3pp42)

YOSH/ ★ D13 62111B/34 ★ J5 4086-652
Salted japanese apricot tablets prodn. - by heating stoned apricots to melt crystals of salt and citric acid, drying, grinding and forming into tablets
YOSHIMOTO H 23.12.77-JA-155362
(10.07.79) A23g-03 A23l-01/34

Process comprises (a) heating stoned, salted japanese apricots at 70-160°C until the crystals of salt and citric acid melt; (b) drying to a moisture content of 8 wt.% at > 50°C; (c) grinding to a powder; and (d) forming into tablets.

Formation of large-sized crystals of salt and citric acid is prevented by drying the mixt. at > 50°C. The dried material is pref. ground to a powder of size < 60 mesh. Dried powder of beefsteak plant (sic) (Perilla frutescens crispa), pigments and flavours may be added. 23.12.77 as 155362 (3pp42)

ASAH ★ D13 62112B/34 ★ J5 4086-653
Natural fruit juice with increased bitterness - obtd. by ultrafiltering electrodialysing filtrate, and mixing ultrafiltration concentrate and acid free filtrate
ASAHI CHEMICAL IND KK 23.12.77-JA-154345
(10.07.79) A23l-02/36

The method comprises (1) treating natural fruit juice by ultrafilatration, (2) electrodialysing the filtrate using an anion exchange membrane and (3) mixing the concentrate of ultrafiltration and the acid-removed filtrate.

Acid is removed from natural fruit juice by ion-exchange resin or electrodialysis for prepn. of fruit juice of constant quality from different fruit. However, running cost of ion exchange is high and anion exchange membrane is easily dirtied by suspended solids, such as pulp, pectin and colloidal substances during electrodialysis. In the present method, these suspended solids are removed by ultrafiltration and the electrodialysis is carried out efficiently. 23.12.77 as 154345 (4pp42)

MORI/ ★ D13 62113B/34 ★ J5 4086-654
Calcium-contg. nutritive pickled food - contg. powder or liq. of oyster shell obtd. by electrolysing oyster shells
MORIYAMA M 21.12.77-JA-152999
(10.07.79) A23l-01/21

The pickled foods contain powder or liquid of the oyster shell, which contains 30-80% Ca and is obtd. by electrolysing oyster shell under 200V-10KV at 500-5000°C in an electric furnace to ionise its components. The oyster shell powder contains Ca oxide, Mg oxide, SiO_2, Al oxide, Fe_2O_3, TiO_2, Na oxide, K oxide, SO_3, P_2O_5, Cl_2 and CO_2. Pref. food materials for the pickled foods are previously immersed in an aq. soln. contg. the oyster shell powder.

The oyster shell powder is easily absorbed in pickled foods, can mitigate the sourness and saltiness of pickled foods and can stabilise pickled foods. 21.12.77 as 152999 (2pp5)

KIBU- ★ D13 62115B/34 ★ J5 4086-662
Pudding-like dessert prepn. - by dissolving sodium citrate in small quantity of water, dissolving cheese in soln., mixing with soln. of sodium arginate, and cooling
KIBUN KK 23.12.77-JA-154326
(10.07.79) A23l-01/18

Process comprises (a) dissolving 0.45-1.14 pts. Na citrate in a small quantity of water; (b) dissolving 100 pts. cheese in the soln. with heating and addn. of water; (c) dissolving 2.59-3.42 pts. Na arginate in water separately; (d) mixing the solns. with stirring at > 80 (> 85)°C; (e) filling into vessels; and (f) cooling to effect gelation.

By adding proper seasoning, sweetener, flavour, etc. a delicious pudding-like dessert food which is free of pasty touch and is uniformly gelled is obtd. 23.12.77 as 154326 (4pp5)

AJIN ★ D13 62116B/34 ★ J5 4086-666
Refreshing cola drink with stable colour and flavour - contains phytic acid instead of phosphoric acid
AJINOMOTO KK 22.12.77-JA-154719
E11 (10.07.79) A23l-02/38

Phytic acid is a natural nontoxic substance, and the cola drink prepd. from it, instead of phosphoric acid, has a similar refreshing taste and odour and has more stable colour and flavour.

Usually phytic acid is used together with another organic acid. When phytic acid is used alone, it is used in an amt. of 0.1-0.8, pref. 0.2-0.6 w/w% of the drink. When used together with another organic acid, it is used in an amt. of 0.05-0.6, pref. 0.05-0.5 w/w% of the drink. 22.12.77 as 154719 (3pp5)

TOXN ★ D13 62117B/34 ★ J5 4086-669
Thermostable colourant for foods - comprises monascus colourant and laccaic acid
TOYO BREWING KK (NICH-) 20.12.77-JA-152369
(10.07.79) A23l-01/27 C09b-61 C12d-13

Thermostable colourant is composed of monascus colourant and laccaic acid in the ratio of 1:0.5-2 expressed on the colour value.

As monascus colourant not only monascus colourant itself, but also monascus colourant complex with protein, peptide, amino acid, nucleotide, nucleic acid base, etc. can be used. The colour value can be determined by dissolving monascus colourant and laccaic acid in solvent such as water, ethanol, etc. respectively and measuring optical density (OD) of the solns. at their max. absorption (monascus colourant : 490-520 nm, laccaic acid: 530 nm wave length). The colour value 1 is so defined that the 0.1% soln. shows OD 0.001.

The mixt. of monascus colourant and laccaic acid is stable to heat and is not discoloured by heating. The obtd. colourant compsn. is used for the uses requiring heating such as sausage, hamburg, roast meat, boiled octopus, boiled beans, bean jam, jam, sweet bean jelly, etc. 20.12.77 as 152369 (9pp5)

KIKK ★ D13 62124B/34 ★ J5 4086-697
Syoyu prepn. - by treating it with cellulose-fixed tannin, gives prod. relatively free of oxidn. discolouration
KIKKOMAN SHOYU KK 23.12.77-JA-154520
A97 (10.07.79) A23l-01/23

Method comprises contacting 'syoyu' with cellulose-fixed tannin at 35-45°C.

Pale reddish 'syoyu' almost free from discoloration by oxidn., can be prepd.

The cellulose-fixed tannin is insoluble in water and is prepd. by bonding ≥1 tannin cpd(s) selected from tannin, activated tannin, tannin-amino derivs. and tannin-carboxyl derivs. with ≥1 cellulose cpd(s) selected from cellulose, activated cellulose, cellulose-amino derivs. and cellulose-carboxyl derivs. through covalent bond. Usually cellulose-fixed tannin is used 1/50-1/400 pref. 1/50-1/200 in volume on 'syoyu' and starting 'syoyu' is passed through the column packed with the fixed tannin at 20-80°C pref. 35-45°C with SV 2-40 pref. 2-20 depending on the colour of 'syoyu' required. 23.12.77 as 154520 (7pp5)

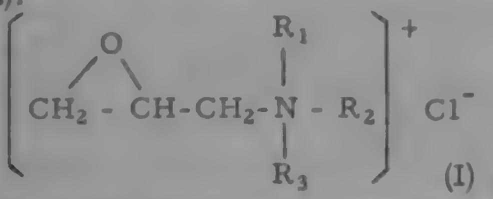
FUJC ★ D13 62277B/34 ★ J5 4087-786

Quat. nitrogen-contg. cellulose derivs. prodn. - using 2,3-epoxypropyltri:alkyl-ammonium chloride as quaternising agent in presence of methanol and e.g. acetone as solvents

FUJI CHEMICAL IND KK 26.12.77-JA-158018

A11 (D15) (12.07.79) B01d-21/ C08b-15/06 C09k-03/16*

Quat. nitrogen-contg. cellulose derivs. having a 2,3-epoxypropyltrialkylammonium chloride substitution degree of > 0.3 are produced by reacting (1) alkali cellulose react with (2) 2,3-epoxypropyltrialkylammonium chloride of formula (I) as the quaternising agent in the presence of (3) reaction solvents comprising (a) methanol and (b) ≥ 1 cpd. selected from acetone, tert-butyl alcohol, isopropanol and acetonitrile in a wt. ratio of 10-80: 90-20 in amts. of 0.3-8 pts. wt. to 1 pt. wt. of cellulose consituting component (1).



$$\left[\overset{O}{CH_2 - CH}-CH_2-\overset{R_1}{\underset{R_3}{N}} - R_2\right]^+ Cl^-$$

(I)

In (I), R_1, R_2 and R_3 are each lower alkyl.

The obtd. cellulose derivs. having a quaternising agent substitution degree of 0.3-0.8 are water-insoluble and highly cationic, and are used pref. as a cellulose ion exchange medium. The cellulose derivs. having a quaternising agent substitution degree of > 0.8 are water-soluble, and are used as coagulants and as antistatic agents. 26.12.77 as 158018 (7pp136)

FUJC ★ D13 62278B/34 ★ J5 4087-787

Quat. nitrogen-contg. cellulose derivs. prodn. - using 2,3-epoxypropyl tri:alkyl-ammonium chloride as quaternising agent in presence of methanol and e.g. acetone

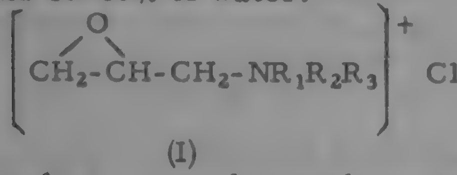
A11 (D15) (12.07.79) B01d-21/ C08b-15/06 C09k-03/16*

Quat. nitrogen-contg. cellulose derivs. having a 2,3-epoxypropyltrialkylammonium chloride substitution degree of > 0.7 are produced by allowing (1) alkali cellulose 1 to react with (2) 2,3-epoxypropyltrialkylammonium chlorides of formula (I) (where R_1, R_2, R_3 are lower alkyl) as the quaternising agent in the presence of (3) the reaction solvents comprising (a) methanol and (b) ≥1 cpd. selected from acetone, tert-butyl alcohol, isopropanol and acetonitrile in a wt. ratio of 20-70:80-30 in amts. of 0.3-8 pts. wt. to 1 part wt. of cellulose constituting Component (1). Pref. the starting raw material, alkali cellulose 1 comprises 20-50 % of cellulose, 5-30% of sodium hydroxide and 40-60% of water.



$$\left[\overset{O}{CH_2-CH}-CH_2-NR_1R_2R_3\right]^+ Cl^-$$

(I)

The present cellulose derivs. having a quaternising agent substitution degree of > 0.7 is highly cationic, being used as a coagulant and an antistatic agent. 26.12.77 as 158019 (9pp136)

ORIY ★ D13 62507B/34 ★ J5 4089-047

Additive for boiled rice - contains L-ascorbic acid, sodium inosinate, sodium glutamate, organic acid and sugar

ORIENTAL YEAST KK 24.12.77-JA-156179

E19 (14.07.79) A23l-01/18

Additive comprises (a) 5000-0.2 mg L-ascorbic acid; (b) 15-0 mg Na inosinate; (c) 200-0 mg Na glutamate; (d) 1500-0 mg organic acid (e.g. citric acid); and 6000-0.1 mg sugar.

Agent not only improves the taste, flavour, colour and glossiness of the boiled rice, but also has an antiseptic effect. It supplies the nutrients which are deficient in the boiled rice. Rice contg. 5000 mg L-ascorbic acid can be used for 'sushi'. 24.12.77 as 156179 (2pp5)

TOPP ★ D13 62508B/34 ★ J5 4089-057

Preservation of scallion - by packaging in e.g. polyethylene with preservative contg. ferrous sulphate hepta:hydrate, calcium hydroxide and opt. sodium bi:carbonate

TOPPAN PRINTING KK 26.12.77-JA-157014

A92 (14.07.79) A23b-07

Method comprises packaging scallions in vessels together with a preservative (I) which can deoxidise or deoxidise and form CO_2 gas and is packaged in a gas-permeable and water-permeable material. (I) consists of ferrous sulphate heptahydrate, calcium hydroxide and opt. sodium bicarbonate as major components and active carbon, iron powder, etc. as minor components.

The oxygen concn. in the vessel can be decreased and i necessary CO_2 gas can be formed in the vessel. Thus, the respiration of scallions can be suppressed and scallions can be kept green without withering for a long time. The vaporisation of water from scallions is prevented by packaging in vessels of plastic material, e.g. polyethylene. 26.12.77 as 157014 (3pp5)

SANW- ★ D13 62511B/34 ★ J5 4089-062

Paste food prepn. - involves use of processed starch and waxy starch mixed in presence of fatty acid mono-glyceride

SANWA SHOJI KK 26.12.77-JA-157044

(14.07.79) A23l-01/32

Method comprises adding a starch mixt. obtd. by mixing 100 pts. of oil and fat-processed starch and 10-80 pt. of waxy starch in the presence of fatty acid monoglyceride, in the material for pasty food.

By the starch mixt. oil and fat-processed starch and waxy starch act synergetically and it serves as the excellent filler for pasty food. Foodstuffs which is equal to high grade pasty food in texture, appearance, taste, resistance to tendancies to revert to prior state on freeze-preservation, etc. can be obtd. 26.12.77 as 157044(6pp5)

TAKE ★ D13 62512B/34 ★ J5 4089-063

Egg-based food, e.g. steamed egg custard, prodn. - by adding glycerine fatty acid mono:ester and sodium pyrophosphate to liq. egg and heat-coagulating

TAKEDA CHEMICAL IND KK 23.12.77-JA-156274

E17 (E34) (14.07.79) A23b-05 A23l-01/32 A23l-03/34

Method comprises combining 0.01-1 w/w% of a glycerine fatty acid monoester (I) and 0.1-2 w/w% of sodium pyrophosphate (II) with liq. egg and heat-coagulating the liq. mixt.

(I) and (II) act synergically for improving the taste and flavour and preservative property of the obtd. egg food which is e.g. steamed egg custard, custard pudding, egg roll, pot-steamed hotchpotch, etc.

Pref. (I) is a monoglyceride of an 8-12C fatty acid and is used in an amt. of 0.01-0.1 w/w% in the objective egg food. (II) is used in an amt. of 0.1-2 (0.2-1) w/w% in the objective egg food. To improve the dissolving velocity of (II), a dissolving aid such as potassium pyrophosphate, lactose, dextrin, etc. may be used. 23.12.77 as 156274 (6pp5)

TOXW ★ D13 62513B/34 ★ J5 4089-066

Sweetener prodn. for use as cane sugar substitute - by extracting Stevia plant and purifying soln. by electrolysis

TOYO INK MFG KK 27.12.77-JA-156361

B03 E13 (14.07.79) A23l-01/22 C07h-01/08

The Stevia plant having leaves is finely crushed and an extract soln. is produced from the resulting pulverised material. The soln. is electrolysed to remove impurities.

Typically, 600 litres of the extract soln. is mixed with 600 g sodium chloride and the electrolysable extract soln. is fed at 30 l/hour into a 30 l electrolysis tank in which electrolysis chambers are defined with aluminium plates having a size of 250 mm (width)x300 mm (length)x3 mm (thickness).

An electric current 50A, 10V is applied to the soln. to give a transparent effluent soln. having a light yellow colour. It is treated with a centrifuge and aluminium hydroxide sludge is sepd. The transparent, light yellowish soln. is passed through a column contg. ion exchange resin, i.e. a mixt. of Amberlite IR-120(H) (RTM) and Amberlite IRA-410(OH) (RTM) and it is desalted. It is decoloured with another ion exchange resin. The resulting transparent soln. is concd. and solidified with a spray dryer. Thus, a light yellowish powder is obtd. for use as a sweetening material. 27.12.77 as 156361 (5pp15)

Condensed milk cooling and crystallising apparatus - with falling film agitated by rotary shaft blades having elements bent alternately in opposite directions

MOGILEV TECHNOL 14.03.77-SU-463076

(16.11.78) A23c-03 A23c-09

The apparatus comprises a vertical cylindrical housing with a cooling jacket and holding a rotary shaft with blades having bent back ends. To improve product quality by providing uniform crystallisation, the edge of each blade is divided over the height by slots into equal-sized elements.

The elements are bent back alternately on opposite sides, while rotor diameter to the elements of one direction exceeds the diameter to opposite elements. Elements of the same direction on adjacent blades are staggered relative to the elements of opposite direction on the same blades.

The arrangement produces repeated changes in direction of a falling film to produce intensive cooling and uniform lactose crystals of 10-15 um size;

Cylindrical autoclave assembly - with cage loading and unloading
by telescopic power cylinder
SCHMALBACH-LUBECA 27.10.76-DT-648709
*P34 (16.08.79) *DT2648-709 A23l-03/10 A61l-03*

Loading baskets for autoclaves are loaded into and withdrawn from the autoclave by means of a reversible mechanical or hydraulic drive arranged with its direction of displacement parallel to the axes of the autoclaves and attached to the rearmost basket of each autoclave. The device is partic. suited to rear loading autoclaves arranged in horizontal banks so that the one reversing mechanism can load or unload all of the autoclaves in a bank at one time.

Since the hand labour of pushing the baskets into the autoclave is eliminated, the goods carried in the baskets are not subjected to rough handling and the loading and unloading is considerably more economic. 27.10.76 as 648709 (5pp1370)

Granulates esp. pastilles coated and dried in revolving drum - with
air entering through inclined perforated wall zones to improve
distribution
DRIAM METALLPRODUKT 11.02.78-DT-805801
P42 (16.08.79) A23g-03/20 B05c-03/08

Appts. for coating granulates such as the cores of pills, pastilles, sweets, etc. to provide an outer casing consists of a revolving drum with horizontal axis and vent connections through perforated parts of the wall to admit and discharge air or other drying gas during the drying process. The air ducts are connected at the ends of the drum to a stationary distributor mounted coaxial to the drum. The connections are such that the air or gas enters the lower part of the bed of granulate and is blown upwards through it.

The central, cylindrical wall of the drum is continuous and the vent connections in the form of perforated wall sections are all arranged inclined to the cylindrical wall. Pref. the air is supplied to the vent connections through radial, hollow external blades mounted on the end walls of the drum.

Economic construction, uniform distribution of the air and thorough mixing of the granulates are achieved. 11,2.78 as 805801 (18pp236).

BERE/ ★ D14 61649B/34 ★DT 2805-942
Homogeniser esp. for mayonnaise creams and emulsions - has
different operating cycles according to viscosity of mixture
BERENTS A 13.02.78-DT-805942
(16.08.79) B01f-07/18

A homogeniser mixer for producing flowable products, esp. mayonnaise, emulsions, creams and the like, where the viscosity is changed during the prodn. process, consists of a mixing vessel with a connected but external revolving homogeniser at the bottom of the vessel. The discharge from this homogeniser passes through a three-way valve to a final discharge and also to a recycling line leading back to the top of the mixing vessel.

The outlet from the homogeniser is also connected to the interior of the mixing vessel via a narrow throttling gap or gaps, esp. an annular gap. The total cross-section of the throttle is small compared to that of the homogeniser outlet. Pref. there is a shut-off valve between the homogeniser outlet and the three-way valve.

In the initial mixing phase, when the liquid is very thin, the shut-off valve can be closed and the revolving homogeniser extracts liquid through its inlet from the bottom of the vessel and passes it back through the narrow throttling gap into the vessel, regardless of the level of liquid in the vessel. When the liquid is more viscous, it is still initially forced through the annular gap until this becomes impossible, whereupon a sensor opens the shut-off valve and allows the material to be recycled. Finally, the contents can be discharged via the 2-way valve. 13.2.78 as 805942 (10pp236).

/MALF/ ★ D14 61869B/34 ★EP ---3-721

Sterilising and blanching food prod. in small pieces - rapidly heated and fluidised by high pressure vapour or gas

MALFANTI J B 10.02.78-CH-001483

Q31 (D22) (22.08.79) A23b-04 A23b-07 B65b-31/02

D/S: E(BE, DT, FR, GB, IT, NL, SW).

In a pressurised chamber, the temp. of the prod. is raised very quickly by contact with a hot vapour or gas which penetrates the outer layer of the prod. and which also serves to fluidise the prod. The heated prod. is then held under adiabatic conditions in a thermally insulated chamber. The holding time in the insulated chamber allows temp. to equalise from surface to centre of each prod. piece as well as effectively sterilising each piece right through. Pressure is reduced and the prod. cooled rapidly after which the prod. is transferred directly to a sterile packaging unit.

The temp. and pressure employed in the process are pref. higher than in conventional sterilisers in order to shorten the overall cycle time. For example, the heating fluid, e.g. steam, is supplied at between 130°C/172 kPa and 176°C/827 kPa to sterilise acid prods. at between 110°C and 133°C up to 168°C for proteins.

Used for simultaneous blanching and sterilisation of food prods. in small pieces, partic. pieces of fruit, vegetables, meat and fish. Faster processing and better quality prods. are obtd. The high temp. applied to the prod. ensures that prod. piece centre temp. rapidly equalises to surface temp. so the prod. surface does not have to be treated for unduly long periods.

The installation now comprises a vertical silo contg. the crop to be dried. Hot air is blown upwards through the contents of the silo and recycled via a vapour compression refrigeration plant employed as a heat pump. Air from the silo is passed first through the evaporator, to be cooled and lose moisture by condensation. The dried air is then directed through the condenser to raise the temp. of the air prior to recycling through the silo.

The installation pref. comprises an elevator which periodically lifts prod. from the base of the silo and returns it to the top. The complete installation is pref. enclosed in a thermally insulated casing. Several silos are pref. arranged around a central elevator which recycles the contents of each silo in turn.

Crop dryer is partic. for cereals such as wheat, maize etc., vegetables such as peas and beans, fruits such as plums and nuts such as almonds. High thermal efficiency is achieved by insulating the complete installation and using both the evaporator and condenser units of the refrigeration plant. Pre-filtered air is continually recycled so that there is no danger of contaminating the crop with external smells and flavours. 10.11.77 as 034515 (11pp448).

Filtration and ion exchanging column - directs forward flow horizontally from vertical distributor and flushes vertically through same connections

NIKEX NEHEZIPARI 13.02.78-HU-DE0952

(22.08.79) B01d-23/12 B01j-01/04 C02b-01/66 C02c-05

D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, SW).

Fluids, esp. water are subjected to filtration and/or ion exchanging, in a column of granular processing material, such as sand for filtration, or ion exchanging material. The fluid flows horizontally through the material column. The fluid is distributed from a vertical slot taking up the whole of the horizontal width of the column at one side. At the other side of the column, the fluid is led away by a perforated collector tube having a smaller cross-section than the outlet slot, from the material column.

For the regeneration of the material column, after draining of the processed fluid, a regenerating fluid is fed from above downwards at high speed. The regenerating fluid is pressed through the perforations of the collector tube so that they are rinsed out clean. At the same time, the material granules in the neighbourhood of the collector tube are flushed and loosened. The regenerating fluid is then drained across the column and is wasted through an overflow.

The creation of dead zones of stagnated sand left by the flushing out process is eliminated. The separate recirculation pipes used normally also increase the investment and maintenance costs of the plant. The blocking of the recirculation pipes with sand also causes downtime and loss of output. The invention increases the efficiency of filtration and ensures quicker and more intensive regeneration and cleaning of the processing material. Special auxiliary pumps or compressors are not required.

Oxygenation of liq sewage - by dissolving high pressure oxygen in carrier solvent subsequently mixed with sewage

BOC LTD 13.05.75-GB-020074
(22.08.79) B01f-13/06 C02c-01/02

The liquid is oxygenated by introducing into a carrier solvent in a closed vessel enough of a pressurised oxygenating gas to form a soln. and to provide a gas pressure in an ullage space above the level of the carrier. The soln. under the gas pressure is introduced into the liq. to be treated. The gas pressure is used to assist in the transfer of the oxygenated carrier solvent from the closed vessel to the liq. to be treated.

Pref. the carrier solvent is the same as the liq. to be treated, and the ullage space occupies 10-30% of the vol. of the closed vessel.

Used to oxygenate liqs. such as sewage having a BOD. The liq. may either by stationary or flowing. The gas can be dissolved without the need to use high pressure pumps. 13.5.76 (7pp295)

JONE/ D15 82661Y/46 =GB 1551-049

Liquid sampling appts. for waste waters - has liq. pumped through sample duct for preset time

JONES R W 19.12.75-GB-052233
*J04 R16 (22.08.79) *US4056-982 G01n-01/14*

Liq. sampling appts. has a liq. displacer linking the inlet to a chamber in which the liq. velocity is reduced; a drive for the displacer; a sample duct joining the outlet to a sample tube which defines an opening disposed in the opposite direction of movement of the liq. when entering the chamber; a pressure sensor in the chamber; and a switch linking the sensor to the drive so that a pressure increase causes the drive to switch from a first state to a second. In the first the displacer drives liq. from the inlet into the chamber and the second allows the liq. to pass from the chamber to the inlet.

Sampler is for use with waste water. 19.12.75 as 052233(7pp1376)

SULZ D15 05982Y/04 =GB 1551-140

Biological microogranism activity control - in sewage treatment by computer fed with oxygen concn. temp. pH and turbidity readings

SULZER BROS LTD 14.07.75-CH-009151
*(22.08.79) *DT2532-199 C02c-01/06*

Biological activity in a sewage treatment plant is supervised and monitored during changes in the working conditions by measuring the pH in the activator and reactivator for activated sludge returned from the activator; measuring the O_2 content, turbity and temp. in the activator; determining the B.O.D. in the activator from the above measurements; maintaining the pH values in the two reactors equal by adding acid or alkali; and varying one of the parameters affecting biological activity in response to the variations in BOD in the activator.

Process is simple, inexpensive, relatively insensitive to disturbances and requires little maintenance. 14.7.76 as 029344(10pp1376)

NIYU- ★ D15 61998B/34 ★J5 4086-443

Sulphate removal from diesel engine cooling water - by addn. of alkaline earth metal or lead hydroxide or nitrite

NIPPON YUSEN KK 23.12.77-JA-154349
E36 Q51 (10.07.79) C23f-11/18 F01p-11/06

Method for removing sulphate ion from the cooling water of diesel engines, comprises adding alkaline earth metal or lead nitrite and/or hydroxide to the cooling water contg. a nitrite series rust inhibitor. Appts. for carrying out the method comprises a valve for receiving of certain vol. of the cooling water, a supply tank provided with a constant volume pump for supplying a predetermined volume of soln. of the nitrite or hydroxide, a mixer for mixing the supplied soln. with the cooling water, and a filter for removing ppte resulting from the reaction of the sulphate ion in the cooling water with the added chemical.

Of the alkali earth metal and lead, barium is most pref. For example, $Ba(NO_2)_2 \cdot H_2O$ 3.8 g and $Ba(OH)_2 \cdot 8H_2O$ are dissolved in distilled water 5 ml and 0.5 volpts are used to treat 100 vol. pts. of cooling water. 23.12.77 as 154349 (4pp53)

Water filtration to reduce pipe corrosion - in which cellulose fibre-active carbon precoat is applied to filter and water is passed through filter

EBARA INFILCO KK 22.12.77-JA-154773
A88 J01 (10.07.79) B01d-37/02

In filtering step through precoated layer, a precoated layer consisting of cellulose powders and active carbon powder is formed on the filtering appts. for condensn. treating purpose and a treating water is permeated through the precoated layer and the filtering appts. The cellulose has a fibre length of $\geqslant 50$ μ and the active carbon has a granular dia. of $\leqslant 100$ mesh. Mixing ratio of the powdery cellulose to the active carbon powders is 1.0/1.0 to 5.0/1.0. The precoated layer has a permeative ability in a velocity range of 5-20 metre/hour during 10-30 minute to the recurrent aq. slurry.

The precoated layer consisting of 0.75 kg/m^2 of the cellulose fibres and 0.25 kg/m^2 of the active carbon powders is fitted on a conventional filtering appts. and thereby, a composite filtering system is prepd. The water contg. 1,680 ppm of iron ion is permeated through the composite filtering system with a recurrent feed velocity of 10 metre/hour for about 8 hours and thereby, the water contg. 2-7 ppm of iron ion is obtd.

A boiler water for fire-power, electric generating plant, contains $\geqslant$ 1,000 ppm of metal colloid and it corrodes piping system so that the boiler water must be treated with the composite filtering system. 22.12.77 as 154773 (3pp15)

Removing cyanogen (cpds.) from sludge combustion exhaust gas - from sewage, night soil, combustion exhaust gas etc., with control of oxygen concn. in incinerator

HITACHI METAL KK 23.12.77-JA-154371

E35 J01 Q73 (E36) (10.07.79) F23g-07/06

Incineration process for the decomposition and removal of cyanogen and cyanogen cpds. contained in combustion exhaust gas (I) of incinerator for sludge sepd. from sewage, night soil, industrial effluents, etc. comprises introducing (I) into an incinerator and contacting with a high temp. flame while maintaining an O_2 concn. of $> 7\%$.

Exhaust gas at temp (T) > 750°C is discharged under the condition of $T \geqslant 1000 - 110\ S$, where T is the temp. of the atmos. inside the incinerator and S is the residence time of gas in seconds. Decomposition of cyanogen and cyanogen cpds. is complete. 23.12.77 as 154371(3pp117)

KOBM ★ D15 62209B/34 ★J5 4087-674

Treating waste water contg. thiosulphate and sulphite - by contacting with sulphur di:oxide and an aq. alkaline soln., then with acid soln. under aeration

KOBE STEEL KK 24.12.77-JA-156150

E34 (12.07.79) C02c-05/02

A method for treatment of waste water (I) contg. thiosulphate (II) and sulphite (III), comprises (1) contacting (I) and sulphur dioxide gas, which is generated in the acid-decomposition reactor described below, with aq. alkaline soln. at < 70°C and pH > 2, (2) treating the soln. exhausted from step (1) with acid soln. under aeration at > 40°C and pH < 3, for decomposition of (II) and (III) and (3) collecting sulphur and sulphate formed.

The efficiency of decomposition of (II) and (III) is high, even if the concn. of (II) in (I) is low. 24.12.77 as 156150 (4pp42)

EBAR ★ D15 62213B/34 ★J5 4087-679

Automatic control of liquid treating appts. - where the amt. of adsorbent added is calculated according to the colour of the liq. before and after treatment

EBARA MFG KK (FUJI-) 24.12.77-JA-156023

(12.07.79) B01d-15 C02b-01/14 C02c-05/02 C13d-03/12

In a liquid treating system including a succession of powder adsorption towers, where the liquid is decoloured, refined or deodorised as it passes through the packed bed, the degree of colouring of the liquid is detected before it enters each tower, and the amount of powder adsorbent to be added to the tower is automatically calculated in connection with the output signal from the detection means.

The degree of colouring of the liquid is also detected when the liquid leaves each tower, to generate and send a feed-back signal to the previous tower for compensation of the control signal calculated in response to the detection signal produced on the entrance side of the tower. 24.12.77 as 156023 (7pp47)

MITR ★ D15 62215B/34 ★J5 4087-681

Tubular semipermeable membrane prodn. - by spreading acrylonitrile polymer soln. on porous support tape, solidifying in non-solvent and joining using e.g. acrylonitrile polymer

MITSUBISHI RAYON KK 23.12.77-JA-156262

A88 J01 (A14) (12.07.79) B01d-13

Prodn. of tubular semi-permeable membrane(I), comprises (1) spreading acrylonitrile polymer (II) soln. on tape (III) of porous support, or impregnating (II)-soln. into (III), (2) soaking (III) into a solvent, which does not dissolve (II), for solidification of (II) and (3) moulding the tape of semi-permeable membrane into a tube, joining edge of the tape by painting a soln. of (II) or other polymer (IV) similar to (II) along the edge and soaking the formed tube in a solvent, which does not dissolve (II) or (IV).

(II) should contain > 65 wt.% of acrylonitrile. As monomer (II), acryl amide, vinyl acetate, styrene, acrylic acid, vinyl benzene sulphonic acid, etc. are used.

If (I) is produced by spreading (II)-soln. on inner surface of tubular support-surface, it is difficult to produce (I) of uniform thickness. (I) produced by the present method has uniform thickness, and the joining position has also semi-permeability. 23.12.77 as 156262 (3pp42)

YAWA ★ D15 62216B/34 ★J5 4087-682

Electrostatic dewatering of sludge - by carrying sludge on conveyor belt through electrostatic field zone then compressing using upper non-charged belt

NIPPON STEEL CORP 23.12.77-JA-155392

(12.07.79) B01d-13/02

A sludge is continuously poured onto a moving conveyor belt which is connected to a D.C. power source to serve as a cathode plate, and is subjected to an electrostatic field produced between the bottom belt and a top belt connected to the opposite terminal of the D.C. power source to caus the sludge to become charged for dewatering purposes. After leaving the first stage electrostatic field, the sludge is subjected to a non-charged compressive action between the bottom belt and a non-charged top belt for a time period > d/2 sec. (d is the wall thickness of the sludge layer on the belt, mm).

Specifically, the interrupted charging cycle is repeated as the sludge is carried on the bottom belt. 23.12.77 as 155392 (5pp47)

EBAI ★ D15 62301B/34 ★J5 4087-976

Precoat-type filter - for removing very small particles of iron oxide and iron hydroxide from condensation

EBARA INFILCO KK 00.00.77-JA-156038

A88 J01 (12.07.79) B01d-37/02

The filter comprises a first precoated layer produced by mixing powdered celluloseand powdered active carbon, and a second precoated layer formed on the first precoated layer and produced by mixing powdered cellulose and powdered synthetic resin prepared by copolymerisation of styrene and divinylbenzene. The condensation is passed through the first and second precoated layers.

Pref. the first precoated layer is produced by mixing powdery cellulose having a fibre length > 100 µ and active carbon powder having a grain size < 100 mesh in the ratio 1:1 to 5:1. The second precoated layer is produced by mixing powdery cellulose having a fibre length of 50 to 100 µ and synthetic resin powder having a grain size < 50 mesh in the ratio 1:5 to 3:1. 00.00.77 as 156038(4pp86)

TOYM ★ D15 62387B/34 ★J5 4088-650

Ammoniacal nitrogen removal from human and industrial waste - using a fluidised bed of solid granules carrying bacteria, maintained under aerobic conditions

TOYOBO KK 25.11.77-JA-141750

(13.07.79) C02c-01/02

The process comprises forming a fluidised bed of solid granular carrier to which are adhered bacteria, supplying the waste water to a treatment vessel from the bottom so that a jet is formed underneath the stabilised expanded layer in the upper part of the fluidised bed; and maintaining the fluidised bed under aerobic conditions.

The ammoniacal N is oxidised to N_2 in a very short time with lower installation costs and easy maintenance.

In an example, activated sludge-treated water is continuously supplied, as a jet, to a vessel packed with anthracite of mean grain size 0.8 mm at a rate of 1.7 m^3/hr, while forming an expanded layer of anthracite. The N content is lowered from 27 ppm to 1.6 ppm over 6 months continuous operation without blocking the bed or lowering efficiency. 25.11.77 as 141750 (4pp34)

TOYM ★ D15 62388B/34 ★J5 4088-651

Denitrification of waste water - using fluidised bed of granular carrier to which are adhered bacteria

TOYOBO KK 07.12.77-JA-147364

(13.07.79) C02c-01/02

NO_3^- nitrogen and NO_2^- -nitrogen contained in waste water, e.g. 'night soil', sewage and industrial effluents etc. are biologically converted by denitrification into N_2 within a very short period and at low installation cost and in very easy operation maintainance by forming a fluidised bed of solid granules carrier to which are adhered bacteria, continuously supplying the NO_2^- and NO_2^- contg. waste water to a treating vessel from its bottom such that a jet stream region is formed at the under side of a stabilised expanded layer positioned at the upper part of the fluidised bed, and maintaining the waste water under an anaerobic state in the presence of an organic hydrogen source, esp. MeOH etc. The jet stream has higher flowing rate than the water transfer rate in the expanded layer while circulating upward and downward in the entire treating vessel, and is formed in extent of 1/10-1/4 times that of the fluidised bed. The jet stream of the water is most desirably formed by horizontally spraying-out the water to be treated, introduced from optional direction, at the centre line of the vessel, by a spraying nozzle, between the centre and the bottom of the under part of the vessel. 7.12.77 as 147364 (4pp34)

TOYM ★ D15 62389B/34 ★J5 4088-652
Organic waste liquor treatment - in which fluidised bed of solid granules carrying bacteria is formed and liquor and effluent is fed to bottom of denitrification vessel
TOYOBO KK 12.12.77-JA-149565
(13.07.79) C02c-01/02

The treatment of organic waste liquor, e.g. night soil and sewage, etc. comprises contacting the organic waste liquor with a portion of a liquor from a nitrification vessel under anaerobic state to convert by denitrification NO^-_3-N and NO^-_2-N into N_2, introducing it into a nitrification vessel wherein NH^+_4-N in the waste water is converted into NO^-_3-N or NO^-_2-N under an aerobic state, and recycling a portion of an effluent discharged from the nitrification vessel to the denitrification step.

The improvement comprises forming a fluidised bed of solid granules carrier to which are stuck bacteria, and supplying continuously organic waste liquor and effluent discharged from the nitrification vessel to the bottom of the denitrification vessel such that a jet stream is formed at the under side of a stabilised expanded layer positioned at the upper part of the fluidised bed.

The treating time is shortened and simultaneously chemical cost is lowered without any troubles, e.g. clogging, etc. during the operation. 12.12.77 as 149565 (5pp34)

KURK ★ D15 62390B/34 ★J5 4088-653
Removal of paramagnetic material from water - by adding ferromagnetic material then passing water through magnetic separator
KURITA WATER IND KK 24.12.77-JA-155098
E31 J01 P41 (13.07.79) B03c-01 C02c-05

Paramagnetic matter, e.g. alpha-FeO(OH), gamma-FeO(OH) and alpha-Fe_2O_3 etc., which are difficult to remove by means of a conventional magnetic filter, are effectively removed from water by adding ferromagnetic matter, e.g. Fe_3O_4, gamma-Fe_2O_3, CuO Fe_2O_3 etc. in an amt. of 0.5-10 wt. pts. against 1 wt. pt. of the paramagnetic matter, and subsequently passing it through a magnetic separating means, e.g. a column packed with steel or stainless steel globules and fitted with permanent magnet or electromagnetic coil at the outside.

By this procedure, ~ 30-55% of the paramagnetic matter is removed, but it is desirable in practice to carry-out recirculation of the water to be treated in order to decrease the paramagnetic matter as much as possible. This process is further applicable for effectively removing a very small amt. of ferromagnetic and paramagnetic matter from water. 24.12.77 as 155098 (5pp34)

TAKE/ ★ D15 62391B/34 ★J5 4088-654
Treatment of sludge contg. aluminium hydroxide(s) etc. - by adding acid, then adding sodium silicate and neutralising to effect concn. and improve dewatering property
TAKEDA F 26.12.77-JA-155523
(13.07.79) C02c-03

Sludge, e.g. from water treatment, contg. Al hydroxides etc. bulky and difficult to be dewatered, is effectively concd. and improved in dewaterability by (i) adding a suitable amt. of an acid, e.g. H_2SO_4 etc. to dissolve a pref. amt. of coagulated flocs so as to regenerate a coagulant, e.g. Al sulphate etc. and (ii) adding Na silicate followed by neutralisation to form newly activated SiO_2 on the outer circumference of sludge granules, to which the regenerated coagulant is bound so as to form an agglomerate exhibiting excellent dewaterability.

The amt. of H_2SO_4 added is ~ 1/10 vol. times as that in a conventional process i.e. the pH is maintained nearby 3.5, thereby the procedure becomes very easy without generation of mal odour or foaming. Further it becomes unnecessary to use $Ca(OH)_2$ in this sludge treatment, thereby effluent and filter cake are maintained in neutral state. 26.12.77 as 155523 (3pp34)

Metal cyan cpds,contg. plating waste water is treated to first remove metal components, and then chlorine and sulphate ions and cyan component etc. to be reused as the washing water in plating treatment.

Process comprises (a) treating with weakly acidic ion exchange resin to lower its pH value from about 10 to 4-8 to prevent deposition of $Ag(CN)^-_2$ or $Cu(CN)^-_2$ on the exchange resin in the form of AgCN or CuCN respectively; (b) adjusting its pH to 3.5-8 opt. with H_2SO_4; (c) treating with activated charcoal to remove by adsorption the metal components, e.g. Ag, Cu and Zn etc.; and (d) subsequently treating in succession the aq. soln. thus obtd. with (i) strongly acidic cation exchange resin, (ii) weakly acidic anion exchange resin and (iii) strongly basic anion exchange resin.

The regeneration of the strongly acidic cation exchange resin with a dil. HCl soln. is facilitated by the pretreatment. 24.12.77 as 155957 (6pp34)

Treating oil contg. industrial wastes - by ultrafiltration and-or reverse osmosis in closed circuit with incinerator
SUMITOMO CHEMICAL KK 08.11.74-JA-129276
*H05 J01 Q73 (28.07.79) *DT2549-882 C02c-05/02 F23g-07/04*

Effluents contg. combustible org. impurities (oil) can be treated by thickening through ultrafiltration and/or reverse osmosis, followed by burning the thickened fluid, The filtrate from ultrafiltration or diluted soln. from reverse osmosis is used in a closed circuit to cool or wash the flue gases from the combustion, and to decompose the org. components contained in the filtrate.

This system has a very low power consumption, just for recirculation and thickening. The thickened residue requires no auxiliary fuel for combustion. The furnace can be kept small because excess water has been removed, and few waste gases are produced. The absence of active carbon filters saves cost and the process is a closed circuit, producing no pollution of the drainage system. 8.11.74 as 129276 C02c-5/02, F23g-7/04 (28.7.79) SUMITOMO CHEMICAL KK (5pp)(J51055155)

Drawing fluid sample through conduit - with initial purging step to reduce cross-contamination
MANNING ENVIRONMENT 02.10.78-US-947742
J04 R16 (07.08.79) G01n-01/14

A fluid sampler withdraws fluid via a flexible hose connected to a sample container. The pressure in the hose can be reduced to draw liq. into the hose and container or alternatively the pressure can be raised to expel fluid from the hose.

Initially liq. is drawn up the hose until a liq. sensor at the upper end of the hose is activated. The pressure in the hose is then reversed to expel the liq. A second cycle takes place in which the liq. is drawn up the hose but this time is allowed to enter the sample container. Optionally the hose can also be flushed by a fresh water cycle.

The appts. periodically takes samples at intervals of typically 6 hrs. The initial flushing of the hose by drawing liq. into it and then expelling it removes traces of the previous sample and dislodges algae which may have grown in the hose since the taking of the previous sample. This reduces cross-contamination between successive samples. 2.10.78 as 947742 (5pp295)

Waste water contg.proteins and carbohydrates is purified in appts. which has a tank from which a sludge produced by aerobic degradation is removed. without allowing O_2 to contact the waste. A second tank inside the first has an aerator to dissolve O_2 in the waste water, the second tank also having an outlet for sludge produced by aerobic degradation.

A conduit connects the tanks together to supply waste water to a posn. above the second tank outlet. There is a device to recycle some of the sludge; and a baffle to guide the sludge in the second tank towards the outlet. There is also device to withdraw purified water from below the baffle in the second tank. 6.3.78 as 884632 (7pp1376)

Prodn. of fibres with a porous structure comprises dissolving suitable polymers in a convenient solvent, mixing the polymer soln. with glycerol, spinning, and removal of glycerol and solvent, (e.g. washing with water). In partic., cellulose triacetate, poly(L-γ-methyl glutamate) or vinyl chloride/vinyl acetate copolymers are used.

The porous fibres obtd. are used as insoluble matrices for chemical or biochemical reagents, (esp. catalysts, enzymes, enzyme inhibitors and proteins), ion-exchange materials, chelating agents or molecular sieves. 23.12.77 as 757787 (5pp047)

KERJ ★ D16 61567B/34 ★DS 2828-235

Recovering pure enzymes from crude tissue extracts - by adsorption on erythrocyte membranes then elution

KERNFORSCHUNGS JULICH 28.06.78-DT-828235

B04 (16.08.79) C07g-07/02

Isolation and purification of enzymes (I) from crude solns. obtd. from animal organs or tissues comprises adsorbing (I) onto a selective absorbant, then eluting (I).

The improvement is that membranes from human or animal erythrocytes are used as adsorbant. Before use those enzymes having an affinity for the membrane (almost) the same as that of (I) are removed, pref. by treatment with the soln. used for elution. The membranes are obtd. conventionally from erythrocytes which have been haemolysed by osmosis. The adsorbants themselves are also claimed.

(I) are used in clinical or food chemistry, botany, microbiology, pharmacology and agricultural chemistry. Provides simple and inexpensive process allowing recovery of individual enzymes in very pure form. 28.6.78 as 828235 (3pp1251)

DECH- ★ D16 61603B/34 ★DT 2805-366

Protein e.g. enzyme immobilisation on porous carrier - with minimal delay between adsorption and covalent binding to give non-homogeneous protein distribution

DECHEMA DEUTSCHE GE 09.02.78-DT-805366

A96 B04 (16.08.79) C07g-07

Prodn. of water-insol. proteins bound covalently to a porous carrier comprises adsorption of an aq. soln. of a protein carrying -COO$^-$ or -NH$_3$$^+$ gps. to an aq. suspension of a finely divided carrier having -NH$_3$$^+$ or -COO$^-$ gps. respectively, and subsequently forming covalent bonds by reaction with a carbodiimide deriv..

In this process, (a) the dissolved polymer to be bound to the carrier is used in an amt. substantially smaller than the amt. which corresponds to the max. adsorption capacity of the carrier for the protein, and (b) immediately after adsorption of the protein the protein is reacted with the carrier by addn. of a carbodiimide deriv., steps (a) and (b) being carried out within a short space of time such that the protein is only bound to the carrier by surface adsorption; and (c) the resulting prod. is sepd. from the reaction medium.

Process enables the protein to be inhomogeneously distributed over the carrier particles. The protein is concentrated on the surface of the porous carrier particles so that effective activity (e.g. enzyme activity) is increased. 9.2.78 as 805366 (18pp280).

BIOT- ★ D16 61639B/34 ★DT 2805-823

Oil extn. by flooding with water - contg. glyco-lipid nonionic surfactants made by biosynthesis (NL 14.8.79)

GES BIOTECH FORSCH (WINT) 11.02.78-DT-805823

E13 H01 Q49 (16.08.79) E21b-43/22

Oil is displaced from rock formations or oil sands by flooding with aq. dispersions of non-ionic glycolipid surfactants made in two stages by (1) continuous or semi-continuous growth of micro-organisms in a mixt. of 1-35 vol. % hydrocarbons with an aq. inorganic nutrient soln. and opt. other growth materials of 20-50°C and pH 3-9 with passage of air opt. enriched with O_2, and (2) sepg. the glycollipid from the cell material by temp., pH or osmotic shock.

The aq. phase is used directly as flooding agent or added to the flooding water, and the cell material, wholly or partly recycled to the culture medium. Pref. specific micro-organism strains are used to obtain glycolipids of known structure.

The controlled conditions allow prodn. of glycolipids of optimum compsn. and structure, which increase the oil yield by flooding. The oil extrd. can be used as carbon source in (A), and formation water contg. $\geqslant$10% salt can be used for sepn. by osmotic shock in (B). Recycling of cell material gives a saving in nutrient salts. 11.2.78 as 805823 (30pp195).

MILE ★ D16 61704B/34 ★DT 2855-433

Test reagent for uric acid determn. - contg. purified animal uricase, chromogen and peroxidase

MILES LABORATORIES INC 13.02.78-US-877500

B04 J04 R16 (16.08.79) C07g-07/02 G01n-31/14

Test reagent comprises a uricase of animal origin, $\geqslant$1 chromogen and a peroxidase.The improvement comprises using a uricase which is free of pH-sensitive impurities with a mol.wt. of $<$6000. Also claimed is the prepn. of such a uricase by fractionating (pref. dialysing) an animal uricase to remove components with a mol.wt. of $<$6000.

The reagent can be used in the diagnosis of uraemia, gout, leukaemia, pulmonary inflammations, etc. It allows the uric acid test to be effected in a single step and has good storage stability. 21.12.78 as 855433 (33pp367).

MEIJ ★ D16 61757B/34 ★DT 2905-066

Antibiotics SF-2050 and SF-2050b - produced by culturing Streptomyces strain (NL 16.8.79)

MEIJI SEIKA KAISHA 14.03.78-JA-028324 (14.02.78-JA-015026)

B04 (16.08.79) A61k-35/70 C07g-11 C12d-09/16

New antibiotics SF-2050 (I) and SF-2050B (II) and their salts are claimed, as is their prodn. by culturing a suitable Streptomyces strain, esp. Streptomyces sp. SF-2050 (ATCC 31450), under aerobic conditions in a medium contg. assimilable C and N sources.

Specifically (I) and (II) are unstable dibasic acids which form stable Na salts. They are characterised by their electrophoretic mobility, UV, IR and NMR spectra, and chromatographic characteristics. (I) has the elementary analysis C 32.5, H 5.0, N 5.8, S 13.3%; (II) has C 33.5, H 3.9, N 5.7, S 13.8%. Both lose their antibacterial activity when treated with NH_2OH. Their Na salts give a negative ninhydrin reaction and a positive NaI reaction.

Cpds. (I) and (II) are antibacterial agents and β-lactamase inhibitors. They are useful as broad-spectrum antibacterial medicaments and disinfectants, e.g. active against B. subtilis, S.aureus, E. coli, Proteus mirabilis, and K. pneumoniae at concns. of 10-80 ug/ml. 10.2.79 as 905066 (48pp367).

Culture medium produced from distillers solubles - involving centrifuging or filtering extract soln., adding alkali, removing resulting ppte., and opt. fractionally centrifuging
KIBUN KK 27.12.77-JA-156669
(14.07.79) C12b-03/12 C12c-11/08 C12d-09/04

An extract soln. contg. distillers-solubles or distillers-dried solubles is treated with a centrifugal sepg. step or a filtering step and then, an alkaline material is added to the produced transparent soln. to adjust its pH to ⩾ 7. The resulting ppte is removed from the prod. opt. components having different mol. wts. are removed from the filtrate by fractional centrifugal sepn.

Alternatively the extract soln. contg. the distillers-solubles or the distillers-dried solubles is treated with the centrifugal sepg. step or the filtering step and the components having different mol. wts. are fractionally sepd. Then an alkaline cpd. is added to the produced transparent soln. to adjust its pH to ⩾ 7 and the ppte obtd. is removed

Distillers-solubles is produced from a waste material which is obtd. in distillating whisky and has hitherto been used as a cattle feed. The above treated, purified distillers-solubles is mixed with amino acid, antibiotic material, organic acid, molasses, decomposed starch and corn steep liquor and thus, a culture medium for fermentation of microorganisms is obtd. The culture medium is very effective for producing enzymes, yeasts and vitamins by microorganism fermentation. 27. 12. 77 as 156669 (27pp15)

AMAN ★ D16 62515B/34 ★J5 4089-082
Collecting enzyme of Rhizopus genus - by extracting from solid culture bran medium using agent contg. mould protease or raw enzyme produced bacterially
AMANO PHARM KK 27.12.77-JA-156671
B04 C03 (14.07.79) C07g-07/02 C12d-13/10

Enzyme produced from Rhizopus Genus is extracted from a solid culture bran medium by using an extracting agent contg. a mould protease or a raw enzyme produced bacterially. The mould protease is produced by fermentation of Aspergillus oryzae, Aspergillus saitoi or Penicillium Monilia. Extracting soln., water, aq. soln. contg. alkali or salts or a mixt. of water and water soluble organic solvent may be used. Pref. the raw enzyme is added in an amt. of 0. 1-0. 001 wt. % to the extracting soln.

In an example, 15 kg of Koji mould was packed in a column of dia. 20 cm as the Koji mould layer having 100 cm of thickness and 25 l of the extracting soln. at 5°C was poured into the column. The fermented soln. was collected at the bottom of the column. Lipase and protease produced from Rhizopus Genus are produced with high yield rate at 5°C.

Lipase and protease produced are used for producing pharmaceuticals or as additives for food or cattle feed. 27. 12. 77 as 156671 (6pp15)

etermination of amylase activity - using malto-oligosaccharide aving aryloxy gps., subjecting substrate to beta-glucosidase and etermining liberated aromatic hydroxy cpd.

TOYOBO KK 12.12.77-JA-149566

B04 J04 R16 (16.07.79) G01n-31/14

ethod for determination of amylase activity, comprises 1) exposing a glycoside of malto-oligosaccharide (pref. hose composed of 4-6 maltose units) having aryloxy gp. ombined with its reducing end through a beta-linkage, 2) subjecting the substrate to subsequent (or simultaneous) ction of beta-glucosidase, and (3) measuring the quantity f liberated aromatic hydroxy cpd.by a suitable method.

Method permits determination of amylase activity with- ut interference from monosaccharides present in the ample.

In an example, 0.5 ml. of 0.25 wt.% soln. of p-nitro- henyl-beta-maltotrioside, 0.5 ml. of 8 U/ml soln. of eta-glucosidase and 1.0 ml. of 0.1 M phosphate buffer oln. (pH 6.9) contg. 0.1 M/ltr of NaCl were mixed to repare the amylase-activity determining reagent. To the eagent, diluted saliva was added and reacted at 37°C for 0 minutes. 2 ml. of 1 M Na_2CO_3 soln. was added to stop he reaction, and the absorbance at 400 nm was determin- ed. The absorbance showed satisfactory linearity with he activity of amylase (Somogy units/dl.). 12.12.77 as 149566 (5pp173)

ong-and short - chain amylose prodn from starch

HAYASHIBARA KK 30.04.68-JA-029243

*(30.07.79) *DT1922-295 C13l-01/12*

tarch is subjected to treatment with α-1, 6-glucosidase to ecompose the polymeric amylopectin into short chain amylose, whereby the natural long chain amylose can be differentiated from the short chain amylose by their mol. wt., and then the two amyloses are separated from each other.

For example, starch is pasted at 100°C and adjusted to concentration of 10% and pH 5-6, followed by rapid cooling in vacuo, and then mixed with enzyme solution of Escherichaiintermedia ATCC 21073 and kept at 45°C for 40 hrs. to allow the reaction to take place. The resulting pptes. are separated by centrifugation, and the resulting liquid portion is cooled to 5°C and the resulting pptes. are further separated by centrifugation. The resulting liquid and the washing solution are spray-dried to give solid. The first pptes. are high polymer amylose, and the second ppte. and the last solid are low molecular amylose. 30.4.68 as 029243 C131-1/12 (30.7.79) HAYASHIBARA KK (5pp22)

Turbo-ejector for aerated liquid - used for aerobic cultures, has vanes which direct liquid to outlet nozzles, where attachments increase aeration
BIOLOG ENG RES INST (SVET=) 06.01.77-SU-441323
(15.11.78) B01f-05/16 C12b-01/16

Turbo-ejector for use in the microbiology inds. can be used for aerating and mixing culture media during the aerobic cultivation of micro-organisms, such as yeast. It comprises body fastened to a hollow shaft and having profiled sections, so that circular jets are formed between them. Vanes are located inside the nozzles for ejecting the gas/liquid mixt. Inside the body is a fan, consisting of two discs with blades placed between them.

The mass-transfer process is improved, due to the increased degree of dispersion of the gas in the liquid, as well as the increased quantity of gas passing through the liquid, by adding attachments around the outside dia. of the discs in the fan for breaking up the liquid flow. The inlet part of the vanes for ejecting the gas/liquid mixt. is placed between the attachments.

Thickening cosmetic, pharmaceutical compsns. etc. - with crosslinked saponified polyacrylamide polymer (BE 14.8.79)
HOECHST AG 14.02.78-DT-806098
A96 B07 (A14) (16.08.79) A61k-09 B01j-01/24

Viscosity of cosmetic, pharmaceutical and industrial compsns. is increased by using as thickener a crosslinked polymer (I) which comprises (k - p) mole% - CH_2.CH-($CONHR_1$)-, p mole% -CH_2.CH(COOM)-, 0-45 mole% -CHR_2-CXR_3- and 0.1-20 mole% crosslinker.

In the formulae R_1 = H and/or CH_2OH in any ratio. R_2 and R_3 = H, or one may also be CH_3. X = CN, 1-8C alkoxy carbonyl (opt. substd. by OH), 1-6C alkanoyloxy, 1-8C alkanoylamino or a pyrrolidone, piperidone or caprolactam ring), phenyl or tri(1-2C) alkoxysilyl. M = alkali meta cation, k = 99.9 to 50 and p = 5 to k.

(I) is made by reacting (mole% of all monomers) k% acrylamide, 0-45 mole% HCR_2 = CXR_3 and 0.1-20% cross-linker in presence of a radical initiator in a water-miscible alcohol. The resulting dispersion is warmed at 30-150°C with p moles MOH to saponify amide gps. then the prod. (a) recovered or (b) after removal of NH_3 methylolated wit 0 to (k-p) mole% paraformaldehyde at 10°C to b.pt. of the lower alkanol solvent.

Used for thickening e.g. skin-care compsns., cosmetics, toothpastes, pharmaceutical tablets, ointments or gels, cleaning compsn. etc. .

(I) have very high swelling power and unlike known polymers prepn. is quick and, as subsequent neutralisatio is not necessary, there is no risk that free residual acid gps. will remain. 14.2.78 as 806098 (31pp1251).

Coloured candle coiled into differently coloured layers - by manipulating laminated block to which ornamental granules are added
KEMPTER H 11.02.78-DT-806372
(16.08.79) C11c-05

Highly decorative coloured effects can be produced on candles of wax, paraffin or stearine, in a series of steps commencing with the casting of a block formed by wax layers of different colours. The block is only cooled to 295 - 328 K and is maintained at this temp. until required for processing. The heated block is folded together and stretched at one side whilst being compressed at the other into a partly spherical lump.

Cuts are then made down the sides and across the bottom to expose the layers and with heating maintained the block is twisted into a pear shape; twisting being continued until a head pulls off. The block is finally moulded into a cylinder, barrel shape or sphere and drilled for the wick. 11.2.78 as 806372 (15pp1014).

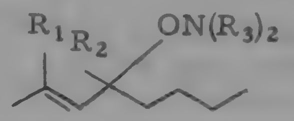
Linear unsatd. alcohol prodn. for use as perfume - by reduction-hydrogenation of di:hydro-linalyl hydroxylamine deriv. in presence of copper-chromite catalyst
NISSAN CHEM IND KK 24.12.77-JA-156027
E16 (13.07.79) B01j-23/86 C07c-29 C07c-33/02

Prepn. comprises reduction-hydrogenating the cpd. of formula (I) in the presence of copper-chromite catalyst. In (I)



(I)

R_{1-2} are each H or lower alkyl and R_3 is alkyl.

Starting dihydrolinalylhydroxylamine is prepd. by hydrogenating linalylhydroxylamine which is prepd. from isoprene, myrcene and geraniol. The reaction is practiced either without solvent or in the solvent which can dissolve both (I) and formed linear unsatd. alcohol. The reaction is practiced at 80-200°C under the pressure of 30-150 kg/cm² using the catalyst in the form of suspension, fixed bed, etc. The linear unsatd. alcohol can be recovered from the reaction mixt. by distn. and opt. further by rectification.

Using copper-chromite catalyst, O-N bond in (I) can be reduction-opened while suppressing the hydrogenation on other unsatd. bonds. Linear unsatd. alcohol partic. dihydrolinalool which is useful as perfume alcohol, can be prepd. from dihydrolinalylhydroxylamine inexpensively. 24.12.77 as 156027 (2pp5)

$$(H)_{n+2}\text{-}C{\equiv}{\equiv}{\equiv}\overset{Z}{\overset{|}{C}}(H)_n\text{-}CH{=}CH\text{-}CH_2\text{-}\overset{\oplus}{P}R_3X^{\ominus}$$

(where R is a hydrocarbon gp; X is CL, Br, I, BF_4 or CLO_4 and either n=1, Z is halogen and the dotted lines represent a single bond or n = O, Z is H and the dotted lines represent a double bond), reacting with hexanal in presence of a base and then, if desired separating the stereoisomers.

Alternatively undeca-1,3-trans-5-cis-triene is prepd. by adding butadiene monoepoxide to a cpd. of formula $CH_3\text{-}(CH_2)_4\text{-}CH\overset{cis}{=}CH\text{-}Me$ (where Me is an alkali metal or residue of a transition metal complex) and halogenating and then dehydrohalogenating the resulting alcohol. The trienes are useful as perfume and flavouring ingredients for foods, pharmaceuticals, tobacco, etc. 7.6.74 as 427608 (17pp068)

LIOY D25 90946X/49 =DS 2621-088

Granular detergent and cleansing compsns. - prepd. by atomising suspensions contg. olefin sulphonate, sodium carbonate, sodium silicate and water

LION FAT & OIL KK 14.05.75-JA-057094

*A97 E17 (A25 E34) (16.08.79) *DT2621-088 C11d-03/10*

Prodn. of a granular washing and cleansing compsn. comprises heating a suspension of active components, pref. to 70-180 (95-160)°C, followed by spraying into an atmosphere at about 20°C or less. The components comprise a mixt. of 10-22 C olefin-sulphonate, (10-30 wt.%); Na_2CO_3, Na_2SiO_3 and water (60-90 wt.%); and the usual additives, (0-30 wt.%). The proportions of Na_2CO_3, Na_2SiO_3 and water are such as to lie in a selected zone of the corresp. triangular phase diagram.

Pref. additives are higher alkylbenzenesulphonates; alkyl sulphates; salts of sulphocarboxylic esters; ethylene oxide adducts with alkanols or alkylphenols; quat. ammonium cpds; and various alkali metal salts. 12.5.76 as 621088 (10pp047)

KONN D25 06068B/04 =DS 2831-778

Enzyme particles resistant to powdering under pressure - contain organic binder, e.g. methylcellulose, and filler; used mainly in detergent compsns. and in pharmaceutical compsns., etc.

GIST-BROCADES NV 20.07.77-GB-030556

*A81 B04 (A96 A97 D16) (16.08.79) *BE-869-132 C07g-07/02 C11d-03/38*

Prodn. of granulates contg. enzymes, which are not easily powdered, comprises mixing suitable carriers, (10-60 wt.%); dry (or nearly dry) enzyme; compatible hydrophilic organic bonding agent, (about 20-60 wt.%); opt. water (to give 5-15 wt.% water content); lubricant, esp. paraffin oil or wax, stearic acid, polyvinyl alcohol, polyvinylpyrrolidone or glycerol; water repellant, (o.5-5 wt.%); and opt. other additives : the mixt. is granulated, separated into required particle size and dried.

Pref. bonding agents are starch and cellulose derivs. Pref. enzymes are protease, amylase, lipase, lactase, invertase and glucoamylase. 19.7.78 as 831778 (9pp047)

HOFS ★ D25 61694B/34 ★DT 2806-450

Cleansing compsn. absorbing oil, fat and wax - contains grain-structured water-repellent and/or cation-active hydrophilic starch

HOFFMANNS STARKEFAB 15.02.78-DT-806450

A97 (A96) (16.08.79) C11d-03/22

Cleansing- and absorbent compsn. contains $\geqslant 50$ wt.%, w.r.t. solids, of grain-structured water-repellent starch (I) and/or cation-active hydrophilic starch, (II), opt. as a suspension or paste with a liq. carrier.

Compsns. contg. (I) are used esp. for absorbing oils, fats or waxes. (I), opt. together with (II), or a starch mol. contg. hydrophobic and cation-active hydrophilic substits., are used for the cleaning and care of natural- and/or chemical fibre textile articles, esp. carpets and upholstery, as well as in dry-cleaning and dry hair-shampoos. The starches, in dry or wet compsns., have high cleansing power and affinity to C black, Fe oxide, kaolin, SiO_2, as well as to fats and oils. Carpet-shape is retained. The starches are easily removed, e.g. by vacuum-cleaning, without removing antistatic or bacteridical finishes. 15.2.78 as 806450 (32pp200).

UNIL ★ D25 61747B/34 ★DT 2904-945

Detergent and esp. dishwashing compsn. - contains specifically active sec. alkyl sulphate isomers and opt. co-surfactant (BE 14.8.79)

UNILEVER NV 14.02.78-GB-005837

A97 (16.08.79) C11d-01/14

The active detergent component in a cleansing- or dishwashing compsn. is a 10-18C sec. alkyl sulphate, (I), contg. $< 50\%$ 2/3-sulphate isomers, (Ia), and > 40 (> 60) % 14 C $^{-2-}$, 15 C $^{-2/3/4/5/6}$-, 16 C $^{-3/4/5/6/7}$- and/or 17 C $^{-7/8/9}$- active isomers, (Ib) (where the additional no. denotes the alkyl chain C atom carrying the sulphate gp.).

(I) have improved cleansing and foaming properties, in hard as well as in soft water. 9.2.79 as 904945 (18pp200).

KAOS ★ D25 61760B/34 ★DT 2905-207

Dry-cleaning compsn. yielding soft antistatic clothes - contains quat. ammonium salt, anionic surfactant, alkanolamine salt and dry-cleaning solvent

KAO SOAP KK 15.02.78-JA-016318

E16 (E14) (16.08.79) C11d-03/43

Cleansing compsn. for dry-cleaning consists by wt. of (A) 5-60 % of $\geqslant 1$ quat. ammonium salt having formula $(R^1R^2R^3R^4N^+)X^-$ (I) (where R^1 is 12-22C alkyl, and R^2 and R^3 are 1-3C alkyl or $\left(CH_2CHR^5O\right)_nH$ in which R^5 is H or Me and n is integer 1-3; R^4 is the same as R^2, or 12-22C alkyl and X is halogen or mono- 1-3 C-alkyl-sulphate, (B) 1-50% of $\geqslant 1$ anionic surfactant alkanolamine salt and (C) 5-80% synthetic or mineral dry-cleaning oil solvent. Wt. ratio (A) : (B) is 100 : 5 to 100 : 60.

Compsns. contg. (A) and (B) are stable, homogeneous, have good solubility in dry-cleaning solvents, high washing power, softening activity, antistatic and corrosion-protective activity. 12.2.79 as 905207 (25pp200).

BORA- ★ D25 61898B/34 ★FR 2408-651

Foam product esp. for cleaning very dirty hands - contg. surfactants, inert powder, antiseptic and foam stabiliser

BORAX FRANCAIS 14.11.77-FR-034134

A97 (13.07.79) C11d-17

The foam for cleaning and softening the hands contains active agents consisting of an aq. complex of anionic and/or nonionic surfactants; an inert powder and an antiseptic, also an agent for stabilising the foam in cellular form.

The foam is prepd. by mixing the aq. complex, antiseptic and stabiliser and the inert powder is suspended in the mass in a homogeneous manner to give the prod. the appearance of an oily foam. Pref. the aq. complex pref. contains an alkane sulphonate in amt. 1-60% and a polyethoxylated alkanol sulphate, such as lauryl ether sulphate sodium salt, in amt. 1-25%.

The prod. is esp. used for cleaning the hands after dirty work. It is effective, does not irritate the skin, and s easy to package, distribute and apply. 14.11.77 as 34134 (5pp597).

ROC D25 12761Y/08 =GB 1551-074

ish washing liquid compsn. of high cleaning and foaming power - ontg. specified mixt. of anionic and nonionic surfactants

PROCTER & GAMBLE CO 08.12.75-CA-241211 (20.08.75-CA-233768)

*A97 E19 (A25) (22.08.79) *BE-845-346 C11d-01/83*

Liq. dishwashing compsn. comprises (a) 10-60 wt.% of a surfactant mixt. of an anionic surfactant (I) and a non-ionic surfactant (II), and (b) a liq. carrier of water and opt. water soluble solvents.

(I) is alkali metal, ammonium and alkanolamine salts that are paraffin sulphonates having 13-21C in the alkyl unit., alkylbenzene sulphonates having 9-15C in the alkyl unit., 12-18C alkyl sulphates and/or α-olefin sulphonates. (II) is an ethoxylated prim., opt. branched, 9-11C alcohol condensed with 3-9 moles of ethylene oxide per mole of alcohol. The wt. ratio of (I) : (II) is 20:1 to 2:3.

Compsn. has improved sudsing qualities with improved greasy soil removal. Compsn. is mild to the hands. 20.8.76 as 034789(12pp982)

PROC D25 21831Y/13 =GB 1551-091

Liq. detergent compsn. contg. anionic surfactant - prepd. from free acid and magnesium hydroxide and alkanol-amine

PROCTER & GAMBLE CO 22.09.75-US-615270

*A97 E19 (E33) (22.08.79) *BE-846-438 C11d-01/83 C11d-03/12 +C11d-10/40*

Prepn. of a homogeneous heavy-duty liq. detergent compsn (I) is claimed. (I) contains a surfactant component (II), comprising detersive amts. of anionic and nonionic surfactants, as well as alkanolamines (III) and Mg salts.

Improvement comprises (a) mixing (II) comprising a detersive amt. of $\geqslant 1$ anionic surfactant, in the free acid form, with $Mg(OH)_2$ to give a mixt. with a soln. pH of 1-5.5 (1-3) and (b) admixing sufficient (III) to give a compsn. with a soln. pH of 6-9 (7-8). Pref. the nonionic surfactant is added with (III). The anionic surfactant is e.g. a 10-18C alkyl-benzenesulphonate and the nonionic surfact is pref. a condensate of ethylene oxide with an alcohol or alkyl phenol.

Typical use concn. os $\geqslant 0.05$ wt.% in an aq. laundering liquor and pref. 0.08-0.5 wt.% for through-the-wash laundering. 21.9.76 as 039080(12pp992)

PROC D25 09277Y/06 =GB 1551-142

Fabric softening microcapsules useful in washing machines - having condensation polymer walls, and core of antistatic-softening agent and m. pt. -lowering cpd.

PROCTER & GAMBLE CO 21.07.75-US-597938 (21.07.75-US-597867)

*A97 E19 F06 (A28) (22.08.79) *BE-844-363 B01j-13/02*

A capsule having a max. particle dimension of $< 400\mu$, esp. useful for incorporation in a liquid fabric conditioning compsn., consists of (a) an inner core of a fabric antistat/softener material and a m.pt. depressant which is a silicone oil or a non-aromatic alkyl or alkoxy ether which is free of functional gps. which react with a monomer used in forming the outer wall, has a b.pt. > 30°C, is capable of lowering the m.pt. of the fabric antistat/softener material by > 5°C, and is present at a level $< 50\%$ of the antistat/softener material; and (b) an outer wall of a product formed by interfacial polycondensation of two monomers.

When the conditioning compsn.-treated fabrics are dried in an automatic clothes dryer, the wall constituent of the capsules rupture to release the fabric antistat/softener material. The dried fabrics have a very satisfactory antistat benefit imparted to them. 21.7.76 as 030348 (9pp990)

LIOY ★ D25 62231B/34 ★J5 4087-708

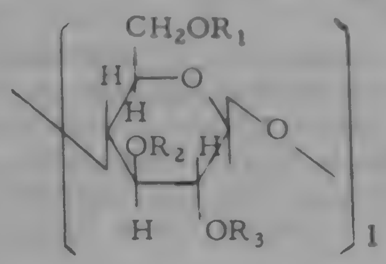
Domestic detergent liq. avoiding spots on dry objects - contains a cellulose deriv. modified by a cation contg. quat. nitrogen, and anionic surfactant

LION FAT & OIL KK 26.12.77-JA-156973

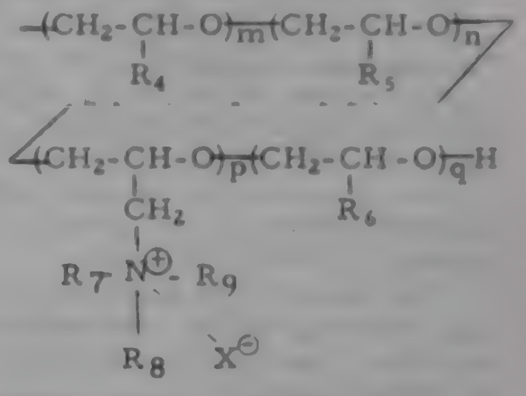
A97 (A11) (12.07.79) C11d-03/38

The detergent consists of 0.05-0.5 wt.% cellulose deriv. denatured by a cation contg. 0.5-3.5 wt.% quat. N, 16-35 wt.% anionic surfactant and balance conventional components. Pref. the denatured cellulose deriv. is a reaction prod. between hydroxyethyl cellulose and glycidyl trialkylammonium salt or 3-halo-2-hydroxypropyl trialkylammonium salt; and the anionic surfactant is a salt of higher alkylbenzene sulphonic acid, a sulphuric acid salt of higher alkyl polyoxyethylene ether, a salt of higher α-olefin sulphonic acid or a sulphuric acid salt of higher alcohol.

Pref. denatured hydroxycellulose is of formula (I) (where R_{1-3} and R_3 are (II);



(I)



R_{4-6} are H or CH_3; R_{7-9} are CH_3, C_2H_5 or C_3H_7; X is halogen; m, n and q are 0-10; the ave. value of m+n+q is 1-3 per unit glucose unit; p = 1-3, and its ave. value per unit glucose radical is 0.1-0.8 and l = 100-2000). Specif. the glycidyl trialkylammonium salt is glycidyl trimethyl ammonium chloride, glycidyl methyldiethyl ammonium chloride, etc.; the 3-halo-2-hydroxypropyl trialkyl ammonium salt is 3-chloro-2-hydroxypropyl trimethyl ammonium chloride, 3-chloro-2-hydroxypropyl trialkyl ammonium salt, etc.; the amt. of denatured cellulose deriv. is 0.05-0.5 wt.%, and the higher alkylbenzene sulphonate used as anionic surfactant has 8-15C alkyl chain. 26.12.77 as 156973 (7pp126)

LIOY ★ D25 62232B/34 ★J5 4087-709

Liq. detergent compsn. for tableware - contains cationically modified starch and anionic surfactant

LION FAT & OIL KK 26.12.77-JA-156974

A97 (A11) (12.07.79) C11d-03/38

The liq. detergent compsn. contains 0.05-5 wt.% of a cationically modified starch (deriv. contg. 0.01-5 wt.% quat. N, 16-35 wt.% anionic surfactant and the balance of conventional components.

Pref. the starch is a reaction prod. between starch and a glycidyl trialkylammonium salt or a 3-halo-2-hydroxypropyl trialkyl ammonium salt, or between hydroxyalkyl (esp. hydroxylethyl or hydroxypropyl) starch and a glycidyl trialkyl ammonium salt or a 3-halo-2-hydroxypropyl trialkyl ammonium salt.

Pref. the anionic surfactant is a salt of a higher alkylbenzene sulphonic acid, a salt of a higher alkyl polyoxyethylene ether sulphate, a salt of a higher α-olefinsulphonic acid or a salt of a higher alcohol sulphate.

Generation of water spots on the surface of tableware after washing and drying is prevented. 26.12.77 as 156974 (7pp126)

PATENT NUMBER INDEX (VII)

Weekly by section and overall. Lists left to right the patent type (* for basic, = for equivalent or # sign for non-convention equivalent or where the priority has been artificially "added" to the specification), patent number, accession number and CPI classes.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

In Basic Abstracts Journal only

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX I

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240	
PCT	40	
Research Disclosure	20	
South Africa	100	
Sweden	260	
United Kingdom unexamined	600	3325

Slow publishing

Canada	450	
Germany, E.	100

Japan examined	340*	
Netherlands examined	60	
Soviet Union	1200	
Switzerland	260	
United Kingdom examined	300	
United States	1200	4375

*Only CPI coverage for Japan.

"Minor" Countries

Complete coverage, but only introduced during 1975, with exception of Italy 1978.

Fast publishing

Brazil	140	
Denmark	120	
Finland	60	
Norway	80	
Portugal	30	430

Slow publishing

Austria	125	
Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

D1: FOOD; FERMENTATION

D11 : BAKING

OCH/ ★ D11 63210B/35 ★CH -612-073
reparing dough for making bread rolls - esp. croissants, using arger portions of dough and fewer turning stages after fat ncorporation
HOCHSTRASSER J C 16.06.76-CH-007660
(13.07.79) A21d-08/02

rodn. of dough for making bread rolls comprises first nixing flour, salt, water and other ingredients, then neading and adding yeast. The dough is then divided up nto portions each corresp. to $\geqslant$5 (pref. 10-15) kg of lour.

A mixt. of fatty material is then spread over each por-ion, then the four sides folded in towards the centre. Each portion is then subjected to 2 successive turning operations then the dough left to ferment, esp. for about 12 hr. Pref. the fatty material is about Y$_3$rd butter and about 300g is applied per kg. flour.

Used esp. for making croissants. The method saves time since larger portions of dought can be used; requires fewer turning stages (and no rolling between each turning). and the dough is easier to process (e.g. it can be cut up into isoceles triangles). The finished rolls have excellent quality and are buttered on the surface. 16.6.76 as 007660 (2pp1251)

TOPF/ D11 07887Y/05 =DS 2532-652
Dumpling dough prepn. from partly cooked potatoes - mixed with starch and salt and packed in plastic foil
TOPFER H J 22.07.75-DT-532652
*Q34 (23.08.79) *DT2532-652 A23l-01/21*

Dough for dumplings is made by heating peeled, raw potato at 80-95°C until the desired percentage of uncooked potato is obtd. The mixt. of cooked and uncooked potato can then be comminuted, mixed with starch, salt and opt. water and made into dough. 22. 7. 75 as 532652 (2pp068)

FRRR D11 24151B/13 =DS 2800-310
Bakery products for use with e.g. milk instead of known cereals - prepd. by baking in hot air spherical bodies made from pref. yeast-free dough contg. proteins
FERRERO P & CIA SPA 21.09.77-IT-069082
*(23.08.79) *DT2800-310 A21d-13/08*

Seamless pastry spherules, (about 10-20 mm dia), are prepd. with an inner cell structure, coated with egg white to exclude air, and have a moisture content $<1\%$; they are treated with milk or fruit juice, cooked (but not in fats), and used as crispy pastry fillings. 4. 1. 78 as 800310(3pp 047)

KLEI/ ★ D11 63239B/35 ★DS 2832-782
Prepn. of bread or confectionery contg. medicaments - by incorporating herbal powders or extracts into dough prior to leavening and baking
KLEINERT G 26.07.78-DT-832782
B07 (23.08.79) A21d-13 A23l-01/30 A61k-09 A61k-35/78

Bread and confectionery is made with the addition of medicaments. The baking process does not adversely affect the active components of herbal preparations. Herbal medicines are incorporated into the dough in the form of fine powders, juices, distillates or extracts and uniformly mixed in. The bread is leavened and baked in the usual manner.

The herbs impart an agreeable taste to the bread. The herbal medicines may even become more active in bread due to biological or chemical effects of leavening. 26. 7. 78 as 832782 (2pp244)

BOSE- ★ D11 63359B/35 ★DT 2807-532
Loaf from different kinds of dough - has bottom layer of specifically heavier whole meal than upper mixed layer
STADTBACKEREI BOSE 22.02.78-DT-807532
(23.08.79) A21d-13/02

Bread formed from different kinds of dough has $\geqslant$2 layers, one upon the other, and is baked in a tin; the underlayer being from a dough which is specifically heavier than the dough of the upper layer or layers.

The expensive practice of cutting and packing slices of wholemeal bread with slices of bright mixed bread, so that there is an interchange of aroma and taste is superceded. Instead the interchange takes place during baking. The method prevents the excessive prodn. of gas which otherwise separates the layers, and the various layers are attached securely together. 22.2.78 as 807532 (7pp1045).

BOUT- ★ D11 63446B/35 ★FR 2409-006
Bakery proving chamber with cool air to delay fermentation - rapidly exhausts cold air on changeover to warm fermenting
BOUTON & BRIQUET 22.11.77-FR-035014
(20.07.79) A21d-04

When changing over from a cooled, delay period to a warm acceleration period, the chamber is equipped to exhaust rapidly to atmos. The mass of cold air occupying the chamber space around the prod., An inlet is provided to allow air at ambient temp. to be drawn into the chamber pref. via an air heater.

Exhaust of chamber air, e.g. by switch inc on a turbine blower, is pref. startes automatically when changing from the delay period, e.g. by means of a timer. The exhaust blower is pref. switched off automatically when the temp. of exhausted air is detected as rising to a set point.

Used as an industrial bakery proving chamber in which dough pieces can be held in storage with fermentation temporarily delayed, e.g. overnight. Rapid warm up from e.g. 0°C to 25°C, produces better quality bread than previous, slower warmup. Overall processing time is reduced. 22.11.77 as 035014 (12pp448)

JACQ- ★ D11 63447B/35 ★FR 2409-007
Bakery prod. pressure baked in extrusion cooker - using as main ingredient conventional bread which is dried and crushed
JACQUET BISCOTTE 16.11.77-FR-034414
(20.07.79) A21d-08 A21d-13

Bakery prod. is prepd in a process of the type in which ingredients, e.g. flour, salt, water, are passed through an extrusion cooker in which they are subjected to high temp. and high pressure. A bread prod. which has been conventionally kneaded, fermented and baked is used as the main ingredient. This is first dried and/or toasted pref. to a moisture content below wt. 10%. The ingredient is then crushed ready for extrusion cooking.

The bread prod. used as main ingredient can be freshly made, just before the drying stage, or it can comprise stale bread and mfg. waste for reworking. Other raw materials such as flour, salt, sugar and starch, can be mixed with the main ingredient just before cooking extrusion.

Since the main ingredient has passed through a fermentation process, the final prod. has an acid pH similar to normal bread. The final prod. is an appetising, low calorie food with a distinct bread flavour and attractive, toasted appearance. 16.11.77 as 034414 (6pp448)

CAUS/ ★ D11 63455B/35 ★FR 2409-096

Machine to brush and spool cloth for bakery proving process - is fitted with mechanism to start cloth winding on spool

CAUSSE R 21.11.77-FR-035138 (22.04.77-FR-012488)

P43 (20.07.79) A21c-11 B08b-01/02

Machine is described in the parent patent for brushing the surface of a cloth and winding the brushed cloth on to a spool to form a removable coil of cloth. In partic. the cloth is one used in an industrial bakery to support and separate bread dough lumps during the proving stage. The machine has a motor-driven spooling cylinder which draws the cloth over the surface of a bristled mat. The brushing surface of the mat is pref. in a plane tangential to the cylinder.

Improvement is that the machine is fitted with a mechanical attachment to hold the leading edge of the cloth against the circumference of the cylinder when starting to wind the cloth on to the cylinder. The attachment pref. comprises a pressure roller freely rotatable on an axis, parallel to that of the cylinder.

Arrangement eliminates the need for special dexterity previously required to start cloth winding on to spool cylinder. Machine output is increased by improved speed of starting spooling. 21.11.77 as 035138 Add to 22.4.77 - 012488 (12pp448)

KONI/ ★ D11 B/35 ★OE 7601-028

Dough pieces portioning, cutting and laying down device

KONIG H 00.00.76-OE-001028

(15.08.79) A21c-05/04 A21c-07/04

PAUL/ D11 74431Y/42 =US 4164-591

Heating prepd. foods esp. pizzas - by grilling, baking and finally passing through convective roasting zone

PAULUCCI J F 02.04.76-US-673114

*Q74 +P28 (14.08.79) *DT2714-762 A21d-08/06*

A food article having a topping of higher specific heat than the crust is cooked by placing the refrigerated article in a heated oven topping up, broiling the topping by passing the article underneath a radiant heater, baking the article in a zone of the oven where convective heated air circulates, toasting the bottom of the crust by applying both convective air and radiant heat, and discharging the article in a ready to eat state. All three stages are carried out in three zones of the same oven.

Pref. the food is rotated through its own axis while being cooked. Pizzas can be cooked using this process. 2.4.76 as 673114 (10pp1376)

PACJ D11 75602A/42 =US 4164-593

Non-caking powdered dough conditioning agent - comprising a mixt. of sodium and calcium salts of a reaction prod. of stearic acid and lactic acid

PATTERSON C J CO 01.04.77-US-783658

*E12 (14.08.79) *NL7803-505 A21d-02/16*

An anti-caking dough conditioning agent is prepd. which consists of 15-90 wt.% of a sodium salt of the reaction prod. of stearic and lactic acids, and 10-85 wt.% of a calcium salt of the same reaction prod. The sodium and calcium salts are commingled in a molten condition and cooled to a solid state.

Pref. the sodium salt comprises sodium stearoyl 2-lactylate, and the calcium salt, calcium stearoyl 2-lactylate. The sodium and calcium salts are initially admixed as respective solids and then coheated for melting the salts, thus commingling in a molten condition.

The compsn. resists caking or agglomeration even when stored under adverse ambient conditions for long periods, enabling the agent to the usable as a free-flowing powder for commercial baking purposes. 1.4.77 as 783658 (6pp931)

D12 : MEAT ; FISH PROCESSING

KOTT/ D12 90734X/49 =DS 2515-067

Skinless smoked sausage - with natural skin produced by hot air blast after smoking of extruded strands

KOTT R 07.04.75-DT-515067

*(23.08.79) *DT2515-067 A22c-11 A23b-04/04*

Prodn. of smoked sausages comprises extrusion of raw sausage meat with thin soluble skins. The sausages are fed to a hot smoking chamber, then dried with warm air at 20-25°C for 36-48 hr. and cut into convenient lengths. 7.4.75 as 515067 (5pp047)

MOHL/ ★ D12 63316B/35 ★DT 2807-059

Kneading machine for pickled or injected meat pieces - has loading chest with containers fitting rotating drum

MOHLMANN G 18.02.78-DT-807059

(23.08.79) A22c-07

Enclosed drum which is free to rotate and can be driven, forms part of a plant for kneading pieces of meat which have been pickled or injected. The drum accommodates a loading chest which is permeable by fluids and is divided into a large number of compartments. The drum is a rectangular container, and a vertical section through its axis of rotation shows it to be square. The loading chest is also rectangular.

Used for kneading or beating the surface of meat pieces after they have been injected with a pickling soln., so that a coating of albumen seals the surface of the meat and prevents the escape of juices. Meat with or without bone can be processed in a gentle and effective manner. 18.2.78 as 807059 (14pp1045).

NUTR- ★ D12 63360B/35 ★DT 2807-554

Removing blood colour by sudden pressure drop - in fatty medium as preparation for use in foodstuffs

NUTRIDAN ENG A/S 22.02.78-DT-807554

(23.08.79) A23j-01/06

Removing the colour from blood and/or centrifuged blood corpuscles in a fat medium, opt. with addn. of proteins, consists of using a substantial pressure gradient, esp. of 200-300 bar, to trigger a reaction which causes the corpuscles to become coated in a protein-fat film, thus losing their colour. The pressure gradient is pref. produced in a homogeniser, esp. operating at 250 bar. The mixt. (blood, fat, protein, water) is pref. heated to 30-70(50)°C before it enters the homogeniser. It may be pretreated in an emulsifier.

Used for prepg. blood for further use in foodstuffs, to remove its characteristic dark colour, against which prejudices exist. The sudden shock generated by the change of pressure produces the desired effect in a very simple manner. 22.2.78 as 807554 (13pp236).

CROA/ ★ D12 63417B/35 ★DT 2905-998

Separating the cheek muscles of a pigs head - by clamping on conveyor for wedge prising jaws open (NL 21.8.79)

CROASDELL D F 17.02.78-EI-000349

(23.08.79) A22c-17

A half of a pig's head is laid on a moving conveyor in such a way that it is held in a predetermined alignment. It is thus presented to a fixed wedge pointing in the opposite direction to that of the motion of the conveyor. The wedge prises open the jaws progressively so that the cheek muscles are sepd. Pref. the skin of the half head is removed before the half head is laid on the conveyor.

Provides a simple means by which the halves of the gs' heads cut open for veterinary inspection can be pro- ssed economically. The bones, skin and meat of the ad can be easily recovered so that the heads do not have be sold as offal. 16.2.79 as 905998 (13pp1045).

Compass saw for cutting up slaughtered animals - has recesses at ntervals along blade and guide DK 3.4.78)
SCHMID & WEZEL 20.12.76-DT-657665
*+P54 P63 R11 (30.08.79) *DT2657-665 +B23d-61/12*

A power saw for carcasses has a longitudinally recipro- cable blade sliding in association with a guide blade fixed o a housing. The saw blade has a guide rod connected at one end and at the other is held by a further guide on the guide blade. The blade back edges have cooperating guide grooves and projections.

The guide groove has gaps open laterally alternately on opposite sides and is formed by oblique surfaces and sloping in opposite directions alternately. The groove and projection are of complementary V-shape, pref. of 60° angle. The pitch of the oblique surfaces is pref. twice that of the saw teeth. 4.7.77. as 027820 (10pp1358)

STRK ★ D12 64159B/35 ★NL 7801-712
Device for cutting around anus and to breast of fowl - cuts circular hole around anus and a curved cut from anus to breast to cut around entrails
STORK PMT BV 15.02.78-NL-001712
(17.08.79) A22c-21/06

A chicken is cut open in such a manner that two cuts are formed, the first a circular cut around the anus and the second travelling from the first in the direction of the breast but also undergoing a sideways displacement away from the centreline and then back to it so that the cutter blade travels around the bird's entrails without the risk of cutting them. The first blade is mounted on a rotating shaft and the second is carried on an arm its direction of movement being determined by a cam and cam follower. The device is mounted on a rotating vertical shaft which rotates at a speed synchronous with the rate at which the chickens are fed into the device. Several of the devices are mounted on one shaft so that the chickens can be automatically processed in a continuous operation.

Device avoids the risk that the entrails of the fowl might be damaged during the cutting open process so that the meat becomes contaminated and the fowl is rejected. 15.2.78 as 001712 (15pp1370)

Process for preservation of mellow cheeses comprises addition of a powdered mixt. or granulate (particles size $>$ 300 μ), contg. finely divided sorbic acid, (5-90 wt.%), and a water-soluble solid, (95-10 wt.%). Prepn. of the additive comprises mixing the components, followed by powdering or granulating and drying. Pref. water-soluble solids are sugar, sugar alcohols, organic acids or their salts or phosphates. 7.11.77 as 749751 (6pp047)

KRUG- ★ D13 63235B/35 ★DS 2828-992
Instant sugar-contg. powders - made by heating dextrose-contg. powder mixts. to release water of crystallisation, and drying the resulting agglomerate
KRUGER & CO KG 01.07.78-DT-828992
(D17) (23.08.79) A23c-09 A23f-01/08 A23f-03 A23l-01/18 A23p-01 C13f-03

Instant sugar-contg. mixts. of powdered substances are made in which the sugar used is at least partially dextrose (α-D-glucose monohydrate) used at $\geqslant$ 9 wt. % on the total mixt. The dextrose-contg. mixt. is heated until the water of crystallisation in the dextrose is released and an agglomerate is formed. The prod. is then dried to form the instant powder.

The process is simpler to carry out than prior art processes and gives instant powders which dissolve rapidly without stirring or other mechanical aid when sprinkled onto water or other liquids such as milk. The process is useful for making e.g. instant sugar powder, instant cocoa drinks, etc. 1.7.78 as 828992 (3pp513)

SCHU/ ★ D13 63241B/35 ★DS 2840-496
Fluidised bed installation reacting solid matter and gases - esp. for polymerisation, heat treatment of coffee beans etc., giving accurate control of periods of interaction
SCHUMACHER H 18.09.78-DT-840496
A18 J04 (A28) (23.08.79) B01j-08/38 C11b-01/04

Heat sensitive materials are subjected to a brief, gentle, thermal processing in a fluidised or swirling bed, in an operation for the carrying out of reactions between solid materials and gases and/or vapours or gas and vapour mixtures. In the process, the gas and/or the vapours or the gas-vapour mixture may constitute the swirling medium or be the swirling and reaction medium also. The solid matter is maintained in the swirling condition, whilst falling freely inside the reactor, with the help of rapidly rotating agitators, and the solid matter is contacted uniformly in countercurrent by the processing gas, the vapour or the gas-vapour mixture.

The gas and/or gas-vapour mixture is injected continuously and constantly as is usual through bores and/or slots in the ribs supporting the beams forming the canted beam floor. The processed solid matter is allowed to pass through the temporarily stepped floor which opens and closes continually, and the gas or gas-vapour mixture, possibly after regeneration is recycled into the reactor. The processing pressure is pref. $\ngtr$ 20 bar and the gas or vapour or gas-vapour mixture temp. at the reactor inlet are 90-110°C.

Used for controlled chemical processes such as polymerisation, oxidation, hydration, and the thermal treatment of seeds, beans, coffee, tea, etc. in which the contact between the solid matter and the gaseous medium is brief and abrupt. 18.9.78 as 840496 (7pp1014)

BOVI/ ★ D13 63288B/35 ★DT 2806-740
Mixing fodder constituents - by weight-batching each constituent from silo and passing fodder onto conveyor leading to buffer tank with level indicators
BOVINGLOH A 17.02.78-DT-806740
C03 P41 (23.08.79) B01f-15/04 B02c-23/02

The constituents of a fodder are mixed by weigh-batching each constituent from a silo. All the weigh-batching units operate simultaneously and discharge their contents onto a conveyor. The conveyor discharges into a buffer vessel, contg. a sensor which starts the conveyor when the buffer vessel is empty and stops it when the buffer vessel is full. The buffer vessel discharges into the mill, typically a hammer mill.

System is simple and economic to operate. 17.2.78 as 806740 (11pp236).

GERC/ ★ D13 63293B/35 ★DT 2806-804
Inhibiting lipase with malonic acid di:ester - or O-acyl-tartronic acid di:ester, e.g. for treating obesity and hyperlipaemia
GERCKEN G 17.02.78-DT-806804
B05 E19 (23.08.79) A61k-37/64 C07g-07/02

Lipases are inhibited by using as substrate-analogous inhibitors malonic acid diesters (I) or O-acyl-tartronic acid diesters (II).

(I) and (II) contain medium-to-long-chain alkyl gps. so hat their hydrophobic properties are similar to those of he natural triglyceride substrates.

Used for medical and industrial purposes and in the ood industry, e.g. for treating adiposity or hyperlipaem-a and protecting fats on the skin or in foods against microbial spoilage. 17.2.78 as 806804 (5pp1251).

MENR- ★ D13 63325B/35 ★DT 2807-208

Beverage powder contg. gelatin - soluble in hot water and useful as dieting aid

MENRATH KG 20.02.78-DT-807208

(23.08.79) A23l-02

Powdered beverage mixt. soluble in warm water to give a gelatin-contg. beverage, comprises an instantly-soluble beverage powder (A) to provide flavour, and finely-divided gelatine powder (B). A quantity of the mixt. intended for reconstitution with 125cc. water contains 2-5(3)g. (B).

Pref. (A) and (B) have particle size about 60 mesh. Typical (A) are coffee, fruit-juice, instant cocoa, soup and tea powders. The mixt. is pref. divided into portions and packaged in vacuum.

As a dietary aid, (B) alleviates the feeling of hunger, is rich in protein but contains relatively few calories. When the mixt. is made up with hot water (B) dissolves easily and does not tend to form clumps. 20.2.78 as 807208 (13pp1251).

CHAJ/ ★ D13 63390B/35 ★DT 2905-007

Edible, fibre-contg. prod. from soybean husks - by extn. with aq. alcohol to remove unpleasant flavours (NL 22.8.79)

CHAJUSS D M 20.02.78-IL-054085

(23.08.79) A23l-01/20

Prodn. of food from soyabean husks (seed skins) comprises extracting them with an aq. alcohol soln., then sepg. the extract and removing the residual alcohol from the husks to give an alcohol-free, extracted dried prod. The husks may also be extracted together with the soyabean 'meat' which is sepd. after extraction.

Used for human consumption. The husks (cheaply available as a by-prod. of soyabean oil recovery) contain much cellulose (up to 50%) and hemicellulose, but little oligosaccharides and no starch, soare useful for providing fibre in human diets. Normally they are used as animal feed because of their unpleasant taste but this is eliminated by aq. alcohol extn. 9.2.79 as 905007 (7pp1251).

DASP- ★ D13 63401B/35 ★DT 2905-575

Peeling fruit and vegetables - by heating with aq. alkali contg. potassium carbonate or phosphate (NL 21.8.79)

DE DANSK SPRITF A/S 17.02.78-DK-000722

*E34 (23.08.79) A23l-01 A23n-07/**

Fruit and vegetables are peeled by heating with an aq. alkali soln. in which the alkali is partly or entirely K_2Co_3 and/or K phosphate.

Quicker peeling is achieved than with solns. contg. only KOH or NaOH, and open vessels can be used. The method can be used to peel produce not intended for cooking. 14.2.79 as 905575 (8pp1251).

A granular water-in-fat emulsion in aq. phase, partic. butter in buttermilk, is made by mechanically working a fat-in-water emulsion, partic. cream, while measuring the electrical conductivity to detect the sudden transition from first emulsion to intermediate structure, or from structure to final emulsion, the working then being continued.

The appts. pref. includes a treatment chamber with a central conductivity electrode controlling the mechanical working occurring between electrode and chamber discharge end. 15.6.76. as 024815 (6pp1358)

PATE- D13 54749A/30 =GB 1551-594

Whey treatment giving prods. with increased protein content - by preliminary removal of lactose by crystallisation and then subjecting to ultrafiltration

PATENT TECHN INC 10.01.77-US-762820

*(30.08.79) *NL7800-265 +C07g-07*

Whey derived from a source having variable protein content is processed to obtain a prod. having whey protein to a desired predetermined protein level. Method comprises removing 45-55% of the lactose content of the source whey by crystallisation and removal of the crystals and subjecting the mother liquor to ultrafiltration to produce a protein rich fraction and a lactose rich permeate. The ultrafiltration is controlled to provide the desired protein level.

During the processing some of the mineral salt content of the material may be removed e.g. by electrodialysis or crystallisation. In the ultrafiltration process, an acceptable and economical flux rate can be provided and long operating cycles are possible before the membrane need be replaced or regenerated. 9.1.78. as 000624 (8pp945)

MERE ★ D13 63486B/35 ★GB 2014-424
Low decomposition rate granulated dietetic foodstuff - comprising casein and carob flour and opt. a coating material
MERCK PATENT GMBH 16.02.78-DT-806514
(30.08.79) A23j-03/02 A23l-01/30

A dietetic foodstuff, in the form of granules of particle size 0.5-5 mm., comprises casein, together with, referred to the dry substance, 0.4-2 wt.% carob flour. The granules are opt. also coated with a vitamin-contg. and/or drageeing mantle.

The granulate is prepd. from a mixt. of the casein and carob flour with about the same amt. of water. The casein is pref. obtd. by acid pptn. from skimmed milk and contains 8-20, esp. 11-13 wt.% moisture. The carob flour pref. has a viscosity of 20-100 cps., as a 1 wt.% aq. soln. at 25°C. The particles are generally cylindrical, pref. with dia. 0.5-2 mm and length 1.5-5 mm.

The foodstuff is esp. suitable for overweight and obesity treatment. The carob flour improves the granulability of casein. The particles are compact and solid. The rate of decomposition in the alimentary tract is low and resorption is slow. The granulate is thermally stable, not changing colour after storage for 3 months at up to 42°C. It shows reduced susceptibility to microbial contamination, compared with known prods. based on curds. 9.2.79 as 004708 (4pp558)

UNIL ★ D13 63487B/35 ★GB 2014-426
Emulsifier mixt. for artificial cream - comprising lecithin and ionic lipophilic and polyoxyalkylene condensate nonionic hydrophilic emulsifiers
UNILEVER NV 15.02.79-GB-005362 (17.02.78-GB-006399)
(30.08.79) A23l-01/19 B01f-17/34

An artificial cream compsn. comprises an aq. dispersion, free of milk protein, of edible fat and contains a novel mixt. of lecithin with an ionic lipophilic emulsifier and a nonionic hydrophilic emulsifier comprising a polyoxyalkylene condensate. The use of a lauric fat; soya lecithin, a lactylated laurate, palmitate or stearate, e.g. Na stearoyl lactylate; and a mono-laurate or -stearate sorbitan ester, e.g. polyoxyethylene sorbitan monostearate, is claimed.

The compsn. can be used as coffee whitener, pouring cream or topping, or whipped to a light cream. It provides a cheaper alternative to the natural prods. and shows superior uniformity of whip. It can be high temp. sterilised to enhance its shelf-life. 15.2.79. as 005362 (4pp558)

HOHN ★ D13 63585B/35 ★J5 4089-893
Edible buffering material prepn. - by adding corn powder, softening agent, foaming agent and opt. water to active sludge then HF heating
HOHNEN OIL KK 26.12.77-JA-157149
C03 Q34 (17.07.79) A23k-01 B65d-65/38 B65d-81/36

Edible buffering material is prepd. by adding (a) corn powder, (b) softening agent, (c) foaming agent and, opt. (d) water to condensed or powder of active sludge and then expanding by high-frequency heating.

Pref. (a) are e.g. corn starch powder, wheat powder, etc. (b) are e.g. propylene glycol, glycerol, sorbitol, etc. (c) are e.g. sodium hydrogen carbonate, ammonium carbonate, baking powder, etc. The amt. of (a) added is 20-80 wt.% based on that of active sludge, that of (b) 5-20 wt.% and that of (c) 5-10 wt.%.

A low-priced active sludge as waste substance is effectively utilised. The edible buffering material does not pollute environment. After the buffering material has been used, it can be used again as feed. 26.12.77 as 157149 (2pp90).

TOXW ★ D13 63709B/35 ★J5 4090-199
Extracting and purifying plant ingredients from e.g. stevia - by adding metallic ions to plant extract and removing impurities by electrolysis
TOYO INK MFG KK 27.12.77-JA-156362
B04 E13 (B03) (17.07.79) C07g-03

Plant ingredients are extracted and purified by adding metallic ions to plant extracts and removing impurities due to action of the produced adsorbent, conductivity of the concurrently-produced salt and action of the adsorbent produced by electrolysis.

Sweetening ingredients are extracted from stevia, sweet tea or liquorice plant by using metallic salts or electrolysis. Impurities can be removed economically and even continuously. Electrolysis and addn. of metallic ions can be carried out independently or concurrently. 27.12.77 as 156362 (4pp104).

TOXW ★ D13 63710B/35 ★J5 4090-200
Extn. and purificn. of plant ingredients e.g. sweetener from liquorice - by adding metal ions which form an adsorbent
TOYO INK MFG KK 27.12.77-JA-156363
B04 E13 (B03) (17.07.79) C07g-03

Plant ingredients are extracted and purified by adding metallic ions to plant extracts and removing impurities by the actions of the produced adsorbent.

Sweetening ingredients are thus extracted effectively from stevia, sweet tea, liquorice etc. Impurities are removed economically.

In an example, dried leaves of stevia were pulverised and sieved through 10mm Ø filter. To pulverised crude material (2kg.) was added water (30kg.) and the mixt. was stirred at 80°C for 30 min. and centrifugally sepd. to give a black brown extract (26kg.). To the extract (5kg.) was added aluminium ethoxide (200g.) and the mixt. stirred at room temp. for 1 hr. to decompose aluminium ethoxide. The mixt. was adjusted to pH 7 with dilute HCl and centrifugally sepd. to give a transparent soln. (about 4.5 kg.). The soln. was passed through a mixt. of Amberlite IR 120(H) (200ml.) and IRA 410 (OH) (400μ) at SV = 2 to give a transparent soln., which was evaporated to dryness to give a slightly yellow powder (24g.). Sweetening ingredient comprised 82%. 27.12.77 as 156363 (3pp104).

SANW- ★ D13 64025B/35 ★J5 4092-619
Antiseptic prepn. - by impregnating vegetable carrier such as potato pulp or peat with alcohol
SANWA SOKO KK 29.12.77-JA-158809
(D17 D22) (23.07.79) A01n-09/24 A01n-17/08

Antiseptic is obtd. by impregnating vegetable carrier such as potato pulp or peat with alcohol. Prod. has a long-lasting effect. Specifically the potato pulp is the dregs obtd. after removal of starch from potato. Pref. the alcohol is a lower alcohol which is volatile at room temp. e.g. ethanol. The antiseptic is sealed with plastics film or metallic foil. Before use, the seal is removed. 19.12.77 as 158809 (2pp108).

ROKK- ★ D13 64037B/35 ★J5 4092-654
Compsn. for mfg. fried cheese - consists of natural cheese and albumin
ROKKO BUTTER KK 27.12.77-JA-159700
(23.07.79) A23c-19/12 A23l-01

A compsn. (I) composed of natural cheese (II) and 0.1-20.0 wt.% of albumin (III) is made by (i) mixing (II) with 1-4 wt.% of melted salt (IV) and 1-20 wt.% of (III), (ii) adjusting the water content to 40-50 wt.%, (iii) moulding the mixt. to suitable shape after heating, melting and mixing, and (iv) cooling it.

As (III), egg-(III) and milk-(III) are used, 15-30 wt.% of sugars may be added to (III) or 0.1-5.0 wt.% of sugars may be added to (I). As sugars, lactose and/or sucrose are/is suitable. Examples of (IV) are pyrophosphate, sodium or potassium polyphosphate, sodium orthophosphate, sodium citrate, etc.

When (I) is fried, (I) does not melt and is not collapsed. Using (I), fried cheese is produced. 27.12.77 as 159700 (3pp42).

Process for regeneration of zeolites contg. adsorbed NH_3, opt. mixed with activated charcoal contg. adsorbed organic cpds., comprises heating at 100-800° (or 400-800° with active charcoal), in the presence of Na^+ and/or K^+ (1-1.5 moles) and Mg^{2+} and/or Ca^{2+}, (0.5-0.75 moles per mole adsorbed NH_3). 1.12.77 as 753612 (+ 5.1.77 - JA - 000113) (11pp047)

HOHM/ ★ D15 63266B/35 ★DT 2806-378
Desalination of sea-water for drinking - using rotating deep-frozen ice balls as ice seeds to freeze out pure water
HOHMANN H 10.02.78-DT-806378
(23.08.79) C02b-01/12

The salt content of a soln. from which drinking water is to be obtd. esp. by the desalination of seawater, is enriched by the prodn. of ice. During each separate, ice-producing process, actually round balls of ice are produced afresh in any pref. manner, before being mixed with the soln. rich in salt, which is to be frozen. The balls are produced from any kind of water, esp. from sweet water having a content of cooking salt <0.05%. The balls of ice are produced away from the salt soln. to be frozen, and they are at least some millimetres in dia.

The sweet water ice balls serve as ice seeds, and before being used their temp. is reduced to a very low level, in a freezing chamber free from water. The deep-frozen balls of sweet water ice are introduced into the salt soln. to be frozen whilst rotating at a very high speed. The rotation is set up in any pref. manner and very thick new ice shells of actually or practically desalinated water form on the surfaces of the deep-frozen sweet water balls which are rapidly rotating separately and act as ice seeds by crystallisation. Or ice, poor in salt as compared with the soln. to be frozen sets out in thick shells, so that the balls forming the ice seeds are increased in dia. by a multiple of their original dia. 10.2.78 as 806378 Add to 2224043 (29pp1045).

HENK ★ D15 63291B/35 ★DT 2806-799
Aluminosilicate granules contg. binder prodn. - useful for partial softening of drinking water to optimum hardness level
HENKEL KG AUF AKTIEN 17.02.78-DT-806799
E33 (23.08.79) C01b-33/28 C02b-01/44

Prodn. of aluminosilicate (I) granules contg. a binder comprises first adjusting an aq. suspension of (I) of particle size <30μ to pH 3-7, maintaining this pH for 15-120 min., then sepg. the solid. This is washed to remove mother liquor, then (dry or wet) mixed with 10-50(20-40)wt.% silicate binder (based on (I) dried at 100°C).

The mixt. is made into a paste with sufficient water to give pH 3-6.5 and total water content 20-55 wt.% on total solids, then granulated in a mixing granulator with gradual addition of water of pH 3-6.5 to give 45-75 wt.% water on solids. The granulate is then dried and hardened by heating at 750-850(780-810)°C for 1-30(5-15)min. They have particle size 0.08-1.5mm.; Ca binding capacity ≥50(100-200)mg Ca per g. at 22°C, and are of compsn. 0.7-1.5 $Na_2O.Al_2O_3.0.8\text{-}6\ SiO_2$.

(I) is an ion-exchanger for domestic partial softening of water. They have low alkalinity; soften water to the optimum value for drinking (2-10, esp. 3-7°dH); have high capacity and rapid action, and have good stability towards hot or cold water. 17.2.78 as 806799 (2pp1251).

SCHU- ★ D15 63314B/35 ★DT 2807-047
Circulator for fermenting sludge sedimenting into vessel sump - has submerged branches sucking up and spraying from centre
SCHULZE O GMBH 18.02.78-DT-807047
(23.08.79) C02c-01/16

An arrangement for circulating sedimenting sewage sludge, in a container with a bottom sump and esp. a circular bottom sump having a vertical cross-section of U- or V-form, consists of a screw shovel with guide tubes which branch out in the bottom zone from the central guide tube, as arms dipping down into the sump.

Used to break up the layer of floating matter on the surface of the fermenting sludge, which if it becomes thick, prevents the escape of gases from the fluid below. The arrangement ensures the faultless circulation of the sludge from the gutter-like sump. It can be applied to any type of vessel in which the sump obstructs the agitation of the sludge. 18.2.78 as 807047 (9pp1045).

HAGE/ ★ D15 63354B/35 ★DT 2807-523
Automatic sterilisation of water by chlorine or bromine - from containers permitting reaction of acid on salts
HAGER K 22.02.78-DT-807523
(23.08.79) C01b-07 C02b-01/36

Gas is produced by the action of an acid or chemicals, which can be used for the sterilisation of water. Used for the sterilisation of swimming pool, drinking water and/or water for general purposes. There is no addn. of chemicals to the water so that the equilibrium of dissolved salts is not affected. The action is independent of the pH value of the water. The matter does not require daily attention since the appts. works automatically over a long period.

This method injects chlorine or bromine gas only. 22.2.78 as 807523 (4pp1045).

HAGE/ ★ D15 63355B/35 ★DT 2807-524
Sterilising appts. for drinking, swimming pool water, etc. - generates chlorine or bromine gas in quantities as required, has two containers, one contg. acid and the other reactants
HAGER K 22.02.78-DT-807524
(23.08.79) C01b-07 C02b-01/36

A disinfecting gas for the sterilisation of water is obtd. by using two containers. One container is filled with an acid, is connected by a hose filled with fibre forming a prefilter, and ≥1 glass or ceramic filter to the second container. This contains the reaction chemicals, and the reaction only takes place when there is some vacuum in this second container.

Used for the disinfection of swimming pools, drinking water and water for general purposes. There is no adding of chemicals to the water so that the equilibrium of the salts dissolved in the water is not disturbed. Impure and substitute chemicals can be used and there is no need for daily attention, since the appts. work independently. 22.2.78 as 807524 (6pp1045).

ASEN/ ★ D15 63357B/35 ★DT 2807-526
Excrement disposal from medium-sized animal stalls - without pollution by extracting air and washing excrement with activated sludge
ASENDORF E 22.02.78-DT-807526
J01 (23.08.79) B01d-47/02

Whilst the air to be vented is being deodorised, the run-off from the floor of small to medium-sized animal rearing stalls, is converted into manure without environmental pollution. In the first of three operations, the air is extracted from the stall, and before going to atmos. it is washed with water contg. activated sludge in a reaction tube in an activating tank. The run-off from the stall is mixed in the reaction tube with the water contg. sludge and is fed with it back to the activating tank. After the activated sludge has been sepd. the clarified water is let off to the drains. Finally the stabilised excess sludge is stored for use as long-term fertiliser.

Used in undertakings with stalls contg. up to fifty animals, as are found on the outskirts of townships. The units can be installed compactly and work highly efficiently. 22.2.78 as 807526 (7pp1045).

CIBA ★ D15 63424B/35 ★DT 2906-334
Semipermeable membrane polymer esp. for reverse osmosis - contains mono- or difunctional cyclic beta-keto acid or ester gps. bonded via ester gp.
CIBA GEIGY AG 21.02.78-CH-001847
A88 J01 (A11 A14) (23.08.79) C08f-08/14

Thermoplastic polymers, for use as semi-permeable membranes, are prepd. by the esterificn. or alcoholysis of cellulose ester derivs. or free OH gp.-contg. cellulose ether derivs., PVA, its ester derivs., vinyl ester copolymers or (meth)acrylate copolymers, with mono- or difunctional cyclic β-ketoacids or their esters, esp. succinylosuccinic acid (I), or its ester derivs. Reaction takes place a the melt phase or in an inert solvent soln. of the polymer

The membranes are used for sepg. materials, esp. by everse osmosis. The modified polymers contain metal helate-forming gps. Chelating can achieve a stationary urface polarisation, increased retention of metal salts in vater purificn. and increased water-absorption. Chelation vith heavy metal salts inhibits biological degradation. 19.2.79 as 906334 (22pp200).

MITC ★ D15 63445B/35 ★DT 2906-998

Sepg. alcoholic beverage from fermentation liquor - with filter material contg. PVA-modified polyolefin flash fibres and auxiliary having zeta potential

MITSUI PETROCHEM IND KK 22.02.78-JA-018591

A88 J01 (A14 A17) (23.08.79) B01d-39/04

Filter material for a solids-liq. phase sepn. contains (A) modified olefin resin fibres consisting of components (a) fibres of polyethylene, C_2H_4 copolymers with <20 wt. % 3- and/or 4C α-olefin, polypropylene and/or C_3H_6 copolymers with <20 wt. % C_2H_4 and/or 4C α-olefin and (b) <5(0.5-4) wt. % w.r.t. (a), of PVA bonded to (a), and (B) <75(5-50) wt. %, w.r.t. (A) of a filter auxiliary which is insoluble or difficultly soluble in water and has a +ve zeta-potential. The fibres (a) are flash fibres, produced by releasing the pressure of a (co)polymer soln. or emulsion, kept at high temp. and pressure, in a lower-pressure zone.

The filter material is used esp. for sepg. alcoholic beverages from fermentation liquors, e.g. of sake, wine, whisky, sherry or beer, and can be used also in the food- and pharmaceutical industry. A clear, bright filtrate is obtd. at a high filtration rate and low filtration pressure, without health hazards and clogging of filters. 22.2.79 as 906998 (20pp200).

CLEV- ★ D15 63458B/35 ★FR 2409-236

Submerged oxygenation of pumped waste water with compressed gas - which is periodically used to backflush pumped water passages (SW 25.6.79)

CLEVEPAK CORP 22.11.77-JA-140554

(20.07.79) B01f-03/04 B01f-05/10 C02c-01/08 C02c-05/10

In a process for mixing a gas partic. air or O_2 into waste water (I), to be purified, (I) is pumped through a tubular mixing passage of which both inlet and outlet are submerged in a tank of (I). A branch entry to the mixing passage serves as an inlet for pressurised gas to mix into (I). (I) with entrained gas bubbles is discharged from the passage outlet into the tank.

To clean out the passage it is back-flushed with pressurised gas. First, the water pump is stopped. Then, without blocking the outlet of the passage, gas is blown through the branch entry into the passage to leave by way of the passage water inlet. This is achieved by piping the passage inlet to a point of lower pressure than that at the passage outlet.

The point of lower pressure is pref. the suction strainer of the pump used to pass water through the passage. The strainer is positioned higher in the tank than the passage outlet. Alternatively, the point of lower pressure can be a vent to atmos. fitted with an isolating valve.

Used for treatment of waste water to reduce organic pollution by oxygenation. The mixing passage can be periodically cleared of deposited debris without any dismantling of the installation. The clearing operation takes little time and needs no skilled attention. 21.11.78 as 032838 (15pp448)

BALA/ D15 63649A/36 #GB 1551-538

Appts. for automatic control of desalination of electrolyte solns. - in a DC electrodialysis machine, has control circuit connected to power source connected to dialysis machine electrodes

BALAVADZE E M 24.02.77-DT-708054 (24.02.77-GB-007893)

A device for automatically controlling the desalination of electrolytic fluids in a direct-flow electrodialysis appts. comprises a current density pick-up connected to a controlled power source; a dilute flow rate sensor mounted on the electrolytic fluid supply or removal pipe; and a current intensity control unit whose differential inputs are electrically coupled to outputs of the current intensity pick-up and diluate flow rate sensor. The output of current intensity control unit is connected to a control circuit of the controlled power source.

The current density is prevented from being increased to a critical value, and accurate process conditions are obtd. 24.2.77. as 007893 (6pp976)

AKER- ★ D15 63493B/35 ★GB 2014-467

Water filter for removing microorganisms, e.g. marine algae - has means for feeding conc. sulphuric acid to the filter unit to remove collected microorganisms

AKERS MEK VERKSTED 06.03.78-NO-000770 (20.02.78-NO-000583)

H01 J01 (30.08.79) B01d-29/38 B01d-37

Filter for water carrying suspended microorganisms comprises $\geqslant 1$ filter unit contg. filter medium, water inlet(s) and outlet(s) and pressure drop controller. At least one filter unit has means for introduction of conc. H_2SO_4 and then a water wash. Pref. the system comprises $\geqslant 2$ units, one being used for filtering while the other is being cleaned. The conc. H_2SO_4 pref. contains a chromate and is stored in a tank which is filled as acid is removed.

The filter is used for removing e.g. algae from saline water to be injected into oil-bearing strata. The H_2SO_4 breaks down or dissolves the marine material. 15.2.79. as 005444 (5pp976)

TAKJ ★ D15 63616B/35 ★J5 4089-973

Solidifying sludge of high water content - by adding prim. treating material of filler and cement, then adding cement

TAISEI CONSTRUCTION KK 27.12.77-JA-159124

L02 Q31 Q42 (17.07.79) B01j-01 B65b-35/02 C04b-13 E02d-03/14

The method comprises mixing a prim. treating material consisting of filler (e.g. gypsum dihydrate) and small amt. of cement into the sludge to lower apparent water content, raise the viscosity of the sludge and prevent the sedimentation of the primarily treated sludge, and mixing a sec. treating material consisting of cement into the treated sludge, and thus solidifying the sludge.

The surface of sludge of high water content (500-700% or more of water) can be solidified, consequently >1m. of earth can be placed on the sludge to prevent the scattering of harmful substances in sludge. By sepg. the treatment into two-stages, the amt. of cement used can be reduced, lowering the treating cost. 27.12.77 as 159124 (4pp50).

NILE- ★ D15 63617B/35 ★J5 4089-975

Evaporator for fresh water prodn. from sea water - using six sets of aligned heat exchange plates with different gaskets

NILEX INGENIEUR AS 26.12.77-JA-157164

J01 Q78 (17.07.79) B01d-01 B01d-03 F28f-03

In an evaporator 6 sets of heat exchange plates (I)-(VI) are aligned in a housing. Plate (I), plates (II), (IV) and (VI) and plates (III) and (V) are fitted with different kinds of peripheral gaskets.

Pref. the plates (III) and (V) have a gasket at both sides and the lower end, and flow openings penetrated through the ends of the plates. 26.12.77 as 157164 (3pp15).

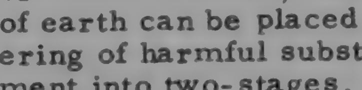
HITA ★ D15 63621B/35 ★J5 4089-982

Reverse permeation membrane - comprising polyamide having alkyl-sulphonamide side chains

HITACHI KK 27.12.77-JA-160117

A88 J01 (A23) (17.07.79) B01d-13

Reverse permeation membrane consists of polyamide having alkylsulphonamide gp. at the side chain consisting of repeat units of formula (I):



$$\left[\mathrm{NH{-}}\underset{\substack{|\\ (\mathrm{SO_2NRR'})_n}}{\mathrm{Ar}}\mathrm{{-}NHCO{-}Q{-}CO}\right] \quad \text{(I)}$$

(where Ar is divalent aromatic nucleus, Q is divalent aromatic or aliphatic radical, R and R' are H or lower alkyl gp. (H is substd. on only one of R and R'), n is 1 or 2, and SO_2NRR' gp. is joined with C atom of Ar not joined with NH_2 gp.).

Reverse permeation membrane consisting of polyamide having alkylsulphonamide gp. on the side chain is made by applying a soln. consisting of (a) polyamide having alkylsulphonamide gp., (b) a solvent for the polyamide (e.g. dimethylformamide) which is miscible with water and (c) inorganic salts (e.g. LiCl, LiBr, $LiNO_3$, $CaCl_2$, etc.) soluble in the solvents to a carrier, evaporating part of solvent from the surface of the coated layer, immersing it in water to form gelatinised film, and finally treating the film in hot water.

The resulting reverse permeation membrane exhibits very high resistance to operational pressure and can be used for long period for sepg. components of soln. of high osmotic pressure such as sea water. 27.12.77 as 160117 (10pp50).

SEKI ★ D15 63626B/35 ★J5 4089-987

Arsenic collecting material - obtd. by reducing keratin-contg. substance to cleave di:sulphide bond

SEKISUI CHEMI IND KK 27.12.77-JA-159179

A91 E32 J01 (17.07.79) B01d-15

An arsenic collecting material is obtd. by reducing a substance contg. keratin as a component (e.g. wool or feather) to cleave disulphide bond of keratin into thiol gp.

The material exhibits excellent absorbing power to arsenic in liq. (e.g. exhaust water from factory of mfg. organic medicines or of synthesizing arsenic agents or waste water from mining), and can be easily handled because it is obtd. in fibrous, granular or film form. Also as wool, feather, etc. can be used the material can be supplied at low cost. 27.12.77 as 159179 (5pp50).

MITP ★ D15 63829B/35 ★J5 4090-868

Purificn. of waste water contg. organic acids - by neutralising with base, concentrating and incinerating, the incineration energy being used for the concn. step

MITSUBISHI PETROCH KK 27.12.77-JA-158286

E17 Q73 (18.07.79) C02c-05 F23g-07/04

A waste water contg. an organic acid having ≤4C e.g. formic acid, acetic acid, acrylic acid, propionic acid and butyric acid, etc. is subjected to purificn. to achieve effective utilisation of thermal energy and to recover fused alkali metal components contained in combusted waste gas as neutralising agent for reuse under circulation.

Process comprises neutralising with an alkali, e.g. NaOH and Na_2CO_3 etc. to convert the organic acids into corresp. alkali metal salts; concentrating the water thus neutralised using the thermal energy generated in the subsequent concentrated waste water incinerating treatment; introducing the concentrated water into an incinerator wherein it is incinerated at 800-1000°C if necessary by the use of assisting fuel to generate the thermal energy to be used for the above concentrating treatment and to produce alkali metal carbonate to be used as the neutralising agent. 27.12.77 as 158286 (6pp34).

Solids. sepn. from waste slurry - using di:cyano-di:amido-formaldehyde and chitosan flocculating agents

NIPPON CARBIDE KOGY KK 29.12.77-JA-158922

*A91 F09 J01 (21.07.79) B01d-21/**

Sepn. of solid from a waste slurry exhausted from pulp industries, protein industries or city effluent treatments, comprises adding a dicyano-diamido-formaldehyde system high mol. type aggregating agent to waste slurry, and centrifugally treating the resulting slurry to separate solid components. The improvement comprises adding the aggregating agent together with a chitosan system cationic high mol. type aggregating agent. The chitosan aggregating agent is chitosan salt of acetic acid, formic acid, or sulphamic acid, which is added in an amt. of 1.0-70 wt.% based on the total amt. of both aggregating agent.

In an example, a dicyandiamido-formaldehyde system high mol. type aggregating agent and a chitosan system cationic high mol. type aggregating agent were dissolved in water to obtain a soln. of 2% of the agent. The soln. was added to a waste sludge, and then centrifugally treated to separate solid components. 29.12.77 as 158922 (6pp51).

Gas-liquid contact appts. - where gas is formed into foam then upward flowing liquid is contacted with foam

NIPPON CLINKAGE KK 29.12.77-JA-159349

(21.07.79) B01d-03/30 B01d-53/18 B01f-03/04 C02c-01/12

A liquid is supplied through a liquid supply pipe in a liquid tank until a cover is submerged in the liquid. When a rotary shaft is driven from a motor to rotate an axial fan, a cylinder, agitating blades and the cover are rotated together, so that a gas is sucked in from a gas introducing pipe. The sucked gas is supplied as foams by means of blades of the fan and introduced downward of the cover by a pressure of a liquid sucked from an annular gap and by upper agitating blades.

The liquid introduced upwards by reversely feeding and agitating blades is powrfully agitated together with the foams to contact it with the foams sufficiently so as to absorb a part of foams in the liquids. The foams are agitated by lower blades to exhaust them from the lower end of the cover in the liquid tank.

The gas and the liquid may be powerfully and sufficiently agitated and contacted for a short time. 29.12.77 as 159349 (3pp35).

Treating plating waste water contg. cyanide and metals - by treating with low grade coal

KAWAZOE A 00.00.76-JA-117606 (10.08.71-JA-060430)

*M11 (08.08.79) *J52155-864 C02c-05/02*

Plating waste water contg. cyanide, Cr, Sn, Zn, and Cd etc. is purified by contacting it with a low grade coal to neutralise it and to remove cyanide and other harmful metal components. Contact is effected by immersion (esp. where the coal is pulverised) or by spraying (esp. where the coal is in lump form).

A surfactant may be used in an amt. of 0.1-3.0% based on the water in combination with the coal to accelerate permeation of the water into the coal, so that its treatment time is shortened to a large extent. The neutralisation of the water is completed only by contacting it with the coal when its pH value is not very low, but it is pref. to neutralise it with lime prior to discharge into rivers when its pH value is very low.

The low grade coal thus treated has increased calorific value (from 2,000-2,500 KCal to 3,000-3,500 KCal) and increased absorbtion area. Fe and S content are decreased (by about 30%). It is suitable for use as an adsorber and a filter material. 10.8.71 as 117606/76 Div. ex 060430/71 C02c-5/02 (8.8.79) KAWAZOE A (3pp) (J52155864)

Microbiological maceration of bast fibres recycle water purificn. - includes specified electrolytic treatment to increase pectin decomposing activity of microorganisms, useful in textile industry

PUNTUKAS CONS BUR 10.11.75-SU-192417

F01 (26.11.78) B01k-01

Recycle water from micro-biological maceration of bast, e.g. flax stalks, is treated electrolytically at a current density of 0.1-3.0 A/dm^2.

Aluminium electrodes are pref. used. By this method the consumption of water is reduced by 30%. and the maceration is accelerated by 45% (the time is reduced to 48-50 h.)

The recycled waters (water squeezed out from the stalks, washing water) contains numerous pectin-decomposing microorganisms so that they decompose the bast must more effeciently than pure water, provided that the recycled waters are freed from contaminations; this is expediently done by electrolysis.

Sulphur cpd. removal from waste water - using carbonised solid waste from vanillin prodn. as high capacity sorbent
LENINGRAD CELL-PAPER INS 02.09.76-SU-399408
(26.11.78) C01b-31/16 C02b-01/14

Adsorbent for the removal of S-cpds. from waste water is based on solid waste from vanillin prodn. (using sulphite-cellulose concentrate) to increase adsorption capacity and water resistance.

The dried residue (contg. 50-53% desulphonated lignin, 45-46% minerals, and 1-5% benzene, resins etc.) is anaerobically carbonised at 500-600°C. The prod. ash-content may be lowered by acid or HCl extn. before or after carbonization.

Mechanical horizontal water aerator - has longitudinal channels with toothed edge fitted at disc periphery, whose concave side faces shaft rotation direction
REPUBLIC DES-CONS 27.05.77-SU-513601
(26.11.78) B01f-03/04 C02c-01/10

The aerator comprises a shaft with a drive having disc-type elements over its entire length. To increase efficiency, with simultaneous decrease in energy consumption, longitudinal channels with a toothed edge are fitted at the disc periphery, their concave side facing the direction of rotation of the shaft.

On half-immersion in the aeration tank, the channel exposed to the atmosphere drives the air into the liquid, which in turn is distributed by the toothed edge to intensify mixing. The breakdown into water droplets is supplemented by satn. with oxygen via the discs carrying a readily-contacted thin film of water. The system gives 7.75 mg/l oxygen satn. concn. in 10 mins., at greatly reduced energy consumption.

ludge centrifuge with automatic sludge discharge - has piston alve movable to intermittently open and close sludge outlets
DE LAVAL SEPARATOR 24.04.78-US-899212
J01 P41 (14.08.79) B04b-01/18

he centrifuge comprises a centrifugal rotor with a piston alve movable axially of the rotor to effect intermittent pening and closing of sludge outlets in the periphery of he rotor. The piston valve normally closes the sludge utlets and moves axially to open them when operating iq. is drained through drain openings at the periphery of closing chamber adjacent the valve, the drain openings eing normally closed by a main slide in an opening chamber.

Operating liq. fed to the opening chamber first moves he main slide axially to open the drain openings, thereby ffecting opening of the sludge outlets. It then overflows nto a third chamber to actuate a second slide and open a rain passage leading from the opening chamber into a hird chamber, whereupon the main slide moves to re-close the drain openings in the closing chamber.

The main slide responds promptly to the supply of operating liq. to the opening chamber and the duration of ach open period of the sludge outlets can be accurately controlled. 24.4.78 as 899212 (7pp67)

Small fermenter for intensive and rapid cell cultures - has extended baffle plates in outer ring chamber
E SCHUTT LAB ARZTE 22.02.78-DT-807445
(23.08.79) C12k-01/10

Microorganisms or cell cultures are propagated continuously or discontinuously, under sterile conditions, in fluid nutrient solns., by means of a small fermenter. This consists of a vertical cylindrical container with an inner working chamber in which a rotary agitator is fitted on a shaft extending over the whole length of the container.

Between the inner chamber and the outer container there is an annular chamber at the bottom of which there is a gas feed inlet. Projecting radially inwards across the outer chamber, baffle plates are fitted. These extend above and below the edges of the inner chamber over the length of the container and reach from the inner wall of the container to the outer wall of the working chamber.

The fermenter is designed partic. to ensure a much better degree of transfer of the gases in the nutrient soln., in the outer annular chamber, and at the same time to reduce the length of time required for fermentation. The extension of the baffles above and below the working chamber intensifies the agitation of the fluid and the gases, whilst in the outer chamber a rapid, rising, laminar flow is set up. Cell densities of 2-20g. dry wt. per litre of nutrient or culture fluid can be achieved. 22.2.78 as 807445 (13pp1045)

SHIO ★ D16 63444B/35 ★DT 2906-996
Antigenic haemagglutinin from Haemophilus gallinarum - for immunising poultry against infectious coryza
SHIONOGI KK 22.02.78-JA-020021
B04 C03 (23.08.79) A61k-39/02 C07g-07

New haemagglutinin obtainable by treatment of cells of Haemophilus gallinarum with trypsin has the properties (a) molecular wt. of sub-units ca 39000, determined by SDS-polyacrylamide gel electrophoresis; (b) protein with fibrous structure; (c) eluted almost at the Vo value of "Sepharose" (RTM) 6B; (d) loses antigenicity and haemagglutinating properties after heating 5 mins. at 100°C; (e) retains haemagglutinating activity after heating ≯5 mins. at 70°C; (f) amino acid content (proportion) lysine (0.73), histidine (0.22), arginine (0.31), aspartic acid (1.00), threonine (0.53), serine (1.09), glutamic acid (1.20), glycine (2.30), alanine (1.02), valine (0.71), isoleucine (0.37) leucine (0.68), tyrosine (0.18), phenylalanine (0.31).

The haemagglutinin is of use in the prodn. of a vaccine or serum for the treatment or prevention of infectious coryza of poultry, which is due to infection with Haemophilus gallinarum. Tests results given in the specification demonstrate the effectiveness of admin. of the haemagglut inin together with aluminium hydroxide adjuvant in protecting chicks against H. gallinarum infection. 22.2.79 as 906996 (16pp280).

Small scale automatic energy producing installation for households - ferments organic matter, yielding methane in daily consumable volume
BARRETH H 22.11.77-FR-035966 (21.07.76-FR-023087)
H09 Q74 (20.07.79) C12d-03/10 F24j-03

A self-regulating, automatic installation produces methane and is intended for use in common by gps of households or by individual establishments such as smallholdings and farms. Prodn is effected by the controlled fermentation of organic matter of animal or vegetable origin in separate metal vessels. These are fed at the same time continuously and intermittently. The gas is produced without interruption at a pressure ensuring completely automatic working without electrical or mechanical control devices.

Used to produce energy in the form of methane gas as i is required without having to store it in pressure vessels of various kinds. The unpleasant work is eliminated and the relatively large amt of equipment previously necessar is reduced considerably. The energy is stored in the form of organic matter and not as gas. 22.11.77 as 035966 Add to 21.7.76 - 023087 (12pp1014)

ASAH ★ D16 63550B/35 ★J5 4043-181

Sepn. of e.g. microbes, cells or inorganics from liq. - by passing liq. over porous film by vibrating film

ASAHI CHEMICAL IND KK 12.09.77-JA-108891
J01 (05.04.79) B01d-13

A liq. contg. fine particles is introduced from a store tank through a pump and a vibration generator to one chamber partitioned by a porous film. The fine particles mean microbes such as bacteria, yeast, linear germs, etc. or cells dissociated from animal or plant tissues, or inorganic substances such as minerals, metals, etc.

Vibration is applied to the porous film and the liq. is flown along the porous film, so that smaller fine particles than the holes of the porous film are filtered to the other chamber. The liq. contg. the unfiltered fine particles is circulated to the store tank after it is diluted and washed with a liq. from a container. The operation is repeated to separate fine particles from the liq.

The liq. contg. fine particles may be continuously filtered in easy operation without damages of fine particles to provide the high filter velocity. 12.9.77 as 108891 (5pp35).

Interferon inducing nucleic acid prepn. - by culturing Cortinellus Shiitake

SUMITOMO CHEMICAL KK 09.08.72-JA-080173

*B04 (07.08.79) *J49035-586 +A61k-45/04 C12d-13/06*

A nucleic acid with interferon inducing ability was prepd. from mycelia of Cortinellus shiitake (I). The substance was a H_2O insol. white power with max. spectral absorption at 258-260 mu, pos. in orcinol reaction.

Precultured (I) was cultured with shaking in a medium contg. glucose 35, polypeptone 2.5, yeast ext. 2.5, KH_2PO_4 1, $MgSO_4$ 0.5, $CaCl_2$ 0.5, NH_4 tartrate 1, $FeCl_36H_2O$ 0.01, $MnCl_24H_2O$ 0.0072, $ZnCl_2$ 0.005 and Cu SO_45H_2O 0.001 g in 1 l. added with 20 mg thiamine HCl/ml at 25° for 3 days. Washed mycelia were freezed at -20° and disintegrated with sea sands, extd. 3 times with 0.0075 M Tris HCl buffer contg. 1 mM EDTA and 0.1 M NaCl (I, pH 7.0) and PhOH satd. with the buffer. The H_2O-phase sepd by centrifugation was shaked with equal vol. Et_2O, 3 times to remove PhOH. The soln. was diluted with 5 times vol. of cold EtOH (-20°) and maintained at -20° overnight. White ppt. was collected by centrifugation and dried in vacuum to give 272 mg of the product from 117 g mycelia. Mice injected i.p. with 1 g powder/kg did not show any abnormal symptom. Original rabbit renal cells were treated with a soln. of the substance for 24 hr. washed twice, and infected with vesicular stomatitis virus with 100 TCID/50 ml (50% tissue culture infectious dose). No infection was found in the cells treated with > 1 μg/ml of the substance, after 24-48 hr. of cultivation. 9.8.72 as 080173 C12d-13/06, A61k-45/04 (7.8.79) SUMITOMO CHEM IND CO (6pp)(J49035586)

C03 (26.11.78) C12k-03

Solubilisation of difficultly soluble phosphates in the soil, mainly $Ca_3(PO_4)_2$ and $Mg_3(PO_4)_2$, so that they can be utilised by plants, is carried out by fungus Proactinomyces phosphaticus which was found in 1966 in humic-carbonate soil. The mycelium grow in the air. The colonies are slightly fluffy. The conidiophores are straight. The conidia are oval or round. The culture is grown at 28-29°C. It produces phosphates. In the soil, the difficultly soluble phosphates are first (in 2-3 days) converted into a soluble from which is subsequently assimilated

Detecting microbial pathogens in lysed blood sample - by centrifuging in test tube with smooth surface insert

WADLEY RES INST BLOOD BK 03.11.77-US-848337

B04 J04 (14.08.79) C12k-01/04

The presence of microbial pathogens in a lysed blood sample is detected by first concentrating the pathogens. The blood and lysing reagent are placed in a vessel e.g. a test tube which is centrifuged to separate the microbial pathogens from the residual lysed blood sample. After concn. the pathogens are removed and cultured.

The end of the test tube against which the pathogens collect is filled by an insert to provide a smooth surface pref. in a plane perpendicular to the centrifugal force.

The method is used to detect septicemia in a blood sample. The smooth face insert provides improved recovery by providing a shorter path length for pathogens and therefore a greater average "g" force. 3.11.77 as 848337 (9pp295)

D17: SUGAR; STARCH

CORP ★ D17 63510B/35 ★GB 2014-578
Dextrose and multi-sugar syrup prodn. - by hydrolysing starch, crystallising dextrose and sepg. solids from liq.
CPC INTERNATIONAL INC 08.02.79-GB-004488 (09.02.78-GB-005294)
(30.08.79) C13k-01/08

Starch is treated so as to produce a hydrolysate contg. 70-90% dextrose and 30-5% at least one other sugar; dextrose is crystallised from the hydrolysate; and the obtd. massecuite is subjected to a solid-liq. sepn. to recover crystalline dextrose and, as the liq. phase, a multi-sugar syrup. The first step is performed, e.g., by saccharifying the starch with glucoamylase and ≥ 1 other enzyme, e.g. a maltogenic enzyme and glucose isomerase (forming maltose and levulose as well as dextrose).

The syrup is more useful and valuable in food applications than the conventional hydrolysed by-prod. of dextrose crystallisation. It can be used directly, blended with other sugars or syrups, or further treated to adjust the saccharide content. 8.2.79. as 004488 (7pp558)

AMAN ★ D17 64036B/35 ★J5 4092-637
High maltose-content syrup prodn. - by treating liquefied starch with culture prod. of Bacillus polymyxa or derived enzymes in presence of alpha-1,6-glucosidase
AMANO PHARM KK 28.12.77-JA-157378
(D16) (23.07.79) C12d-13

Prodn. of syrup (I) contg. > 80 wt.% maltose, 8-15 wt.% malto-triose and < 0.4 wt.% glucose, comprises treating liquefied starch of D.E. < 5 with culture prod. (II) of Bacillus polymyxa or enzyme (III) obtd. from (II), in the presence of α-1,6-glucosidase, where the ratio of the activities of α-amylase/β-amlyase should be 0.02-0.2.

Suitably 20-35 wt.% soln. of starch is liquefied by the treatment with α-amylase at 80-90°C. Then α-1,6-glucosidase produced by Aerobacter or Pseudomonas and (II) or (III) is added to the liquefied starch soln. and it is allowed to stand at 60°C for 20-48 hrs. The soln. is treated with activated carbon and/or ion exchange resin and concentrated.

In the syrup contg. > 80 wt.% maltose, which is prepd. by other known methods, maltose crystallises easily, depending on whether the syrup contains relatively highly polymerised saccharides. In the present (I), crystals of maltose are hardly formed. 28.12.77 as 157378 (5pp42).

Chelate-contng. cellulose material tobacco substitute - in which chelateis an (alkaline earth and/or divalent manganese) iron or aluminium chelate
HAARMANN & REIMER GMBH 22.12.72-DT-262829
*A97 E12 P15 (23.08.79) *DT2262-829 A24b-15/05*

A smokable prod. is made from a combustible cellulose material and an alkaline earth and/or manganese (II)-metal (III)-chelate cpd. Metal (III)- chelate cpds. are defined as complex anions with trivalent Fe or Al as central atom and anions of chelate forming organic acids as ligand. The prod. gives a smoke similar to natural tobacco.
22.12.72 as 262829 (15pp068)

SIRE/ ★ D18 63432B/35 ★DT 2906-510
Filter material for gas or liq. media, esp. tobacco smoke - using matrix of active carbon contg. at least one metal, the matrix formed by pyrolysing e.g. starch or cellulose derivs. (be 20.8.79)
SIREN M J 21.02.78-SW-002007 (21.02.78-SW-002006)
A35 J01 P15 (A11) (23.08.79) A24b-15/03 B01d-39/14

The anionic gps. of a polyhexose deriv. are reacted with cations contg. at least one of the metals Ca, Mg, Ba, Al, Cu and/or the transition metals; and the reaction prod. is pyrolysed and activated so the metal is uniformly distributed in the active carbon.

The active carbon is pref. obtd. from a starch or cellulose deriv. in which the anions are carboxyl-, sulpho- or phosphoric acid- gps.; and the deriv. may be crosslinked via a cpd. such as epichlorohydrin, esp. to obtain material swelling from 1-50ml/g. in water. The active carbon pref. contains 1-3 metals, esp. 10-35 wt.% of metals, and partic. min. 15% Ca with Fe and/or Cu in an amt. equal to 10% of the Ca.

Used esp. as a filter for purifying tobacco smoke or for the purificn. of blood. 20.2.79 as 906510 (19pp1144).

WLSO ★ D18 63482B/35 ★GB 1551-412
Grading skins by measuring thickness and visually assessing grade - then measuring skin area and summing total batch area
WILSON E & SON LTD (FORT-) 17.08.76-GB-034094
R16 (30.08.79) G01n-33

Skins are categorised by passing through an assessment station. Within the station the thickness and area of each skin is measured while it is advanced by a conveyor. In addn. an operator grades the skin quality into one of a number of grades.

The appts. typically has 3 quality gradings and 5 thickness classes so that a skin may fall into one of 15 categories. A summation circuit is provided for each of these categories and is incremented by the area of the skin being examined. Thus each summation circuit indicates the total area of skins examined in each category. A signal is generated when a preset area is indicated by a summation circuit.

The appts. categorises skins at the 'wet-blue' stage and produces for dyeing batches of preset total area of skins with the same thickness and quality. Controlling the total area of a batch produces more efficient dyeing.
10.8.77. (7pp295)

YGOS ★ D18 64018B/35 ★J5 4092-601
Leather dyeing method - using water-insoluble azo cpd. contg. hydroxy- or carboxylic gps. obtd. by coupling reaction, without drying
YAMAMOTO KAGAKU GOS KK (UCHI-) 29.12.77-JA-160067
E21 (23.07.79) D06p-03/32

Method comprises using coloured water insoluble or hardly soluble azo cpd. contg. OH and/or carboxylic gps. which is obtd. by coupling reaction, without drying. Leather can be dyed homogeneously and strongly.

In an example, anthranilic acid is dissolved in hydrochloric acid soln. and to the soln. is added sodium nitrite soln. under cooling to allow diazo reaction to take place. To the resultant is added alkali soln. of β-naphthol under cooling to allow coupling reaction to take place. The resultant is washed with water, and mixed with water and dispersing aid, followed by homogenising, whereby red homogeneous dispersion of solid content of 10% is obtd.

Work-basket for sterilisation baths - esp. for objects such as rubber teats which would otherwise float on sterilising medium

RICHARDSON-MERRELL INC 18.01.67-DT-642159

A35 P34 (23.08.79) A61l-03/02

A rectangular basket is made from four vertical grids, one of which is removable providing access to two side grids which are each fitted with guide rails for sliding trays (a). The vertical stack of trays(a) is used to receive and locate the objects, e.g. teats, so they cannot float upwards.

Each tray(a) pref. consists of wire grids coated with plastic; or pressed or drawn plastic; and all the trays(a) are pref. identical. The advantage is that all the objects are correctly aligned to permit entry of sterilising media and the escape of air from teats etc. The teats are used e.g. on milk bottles for babies. 18.1.67 as 642159 (5pp1144)

Disinfectant contains (a) 1-10 pts.wt. of a germicidal organotin cpd. e.g. a trialkyltin hydroxide, (b) 0.05-100 pts. wt. of a germicidal quat. ammonium cpd., e.g. alkyldimethyldichlorobenzyl ammonium choride (c) 10-200 pts. wt. lower aliphatic dialdehyde (d) $\geqslant$ 10 pts.wt. isopropanol and opt. (e) 1-20 pts.wt. emulsifier and 0.1-10 pts.wt. salicylic acid (salt).

The disinfectant has a greatly increased germicidal activity. 14.9.70 as 045337 (5pp068)

UNIL ★ D22 63269B/35 ★DT 2806-402

Rendering plastics foil water permeable - by passing heated foil through nip of cooled embossing rollers and passing through heated nip to rupture embossing projections

UNILEVER NV 15.02.78-DT-806402

A32 +P34 (23.08.79) A61l-15 B29d-07/22

Moisture permeable plastics foil is produced by heating the thermoplastic foil to a temp. adjacent the plastic range for deformation purposes by a pair of embossing rollers and simultaneous cooling to the thermo-elastic range by the rollers, and following further cooling the embossed projections of the foil are heated for a short period to the deformation temp. to shrink the projections and form apertures in the projections.

Used as cover foils for disposable diapers. Apertured projections promote capillary suction action. 15.2.78 as 806402 (19pp536).

POLQ ★ D22 63399B/35 ★ DT 2905-451
Foil-forming thermoplastic compsn. for orthopaedic use - contains polycaprolactone, cis-1,4- poly di:olefin, opt. ionomer and silica or silicate filler
POLYSAR LTD 17.02.78-CA-297189
A96 (23.08.79)*C08g C08k-03/36 C08l-09 C08l-67/04 C08p

New compsn. having thermoplastic properties contains (1) 70-80 pts. wt. poly-(ε-caprolactone) (I), 5-20 pts. wt. mainly cis-1,4-polydiolefin (II), and 0-10 pts. wt. ionomer (III), making up 100 pts. wt. polymer and (2) as filler, 10-30 wt.% w.r.t. polymer of SiO_2 or Ca silicate.

The compsns. are used esp. as foils, e.g. for orthopaedics, to form splints or bandages. They are miscible, have Shore C hardness 70-90; flexural strength $>100(>125)$kg/cm^2; bending modulus $>3000(>4000)$kg/cm^2; foils can be bent at room temp. by 180° without cracking or breaking. On heating to 60°C, e.g. by immersion in warm water, the foils do not lose their whole strength and can carry their own wt. without sagging. Foils adhere well to one another and can be worked 2-5 min. without becoming sticky. 13.2.79 as 905451 (12pp200).

Leather watch strap - coated with film of fluorocarbon resin opt. contg. steriliser to prevent growth of microbes and irritation of the skin
MASHIDA T 29.12.77-JA-160006
A86 P23 (23.07.79) A44c-05

A watch strap comprises film of fluorine resin on the surface of natural leather of strap material. The fluorine resi may opt. contain steriliser dispersed in it.

Fluorine resin is dissolved in solvent such as chlorinated solvent (e.g. 1,1,1-trichloroethane contg. 5% n-butyl acetate, trichloroethylene or freon-11, etc.), the soln. is applied to leather strap and the solvent is evaporated, forming a film of fluorine resin. Steriliser used is e.g. 2-(4-thiazolyl)-benzimidazole, N-dimethyl-N'-phenyl-N'-(fluorodichloromethylthio)-sulphamide, o-phenyl-phenol, etc. About 0.1-0.5% of steriliser is mixed into fluorine resin.

The resulting watch strap can prevent the propagation of infectious microbes such as mould on the surface by sweat or fat, and direct irritation of reagents and dye remaining in the band material to skin, which causes rash, can be prevented. 29.12.77 as 160006 (3pp50).

Steam sterilising fabrics after conditioning cycle - with cycle modification dependent on load characteristics e.g. absorbency

AMERICAN STERILIZER 11.11.77-US-850845

P34 (14.08.79) A61l-01 A61l-03 A61l-05

A load of material which may include hard and soft goods is placed in a sealable chamber and steam sterilised. Prior to the sterilising operation the load is conditioned by removing air and heating. During this conditioning phase the pressure is lowered until a predetermined time has elasped and a predetermined low pressure has been reached.

When this condition is satisfied the pressure is increased to a preset maximum value at which point a second conditioning cycle is activated. Pref. there are four such conditioning cycles.

The method sterilises mixed goods, esp. fabrics. The method adapts the sequence in response to different loads of goods. For a large load evacuation continues until a low pressure is reached; for a small load where evacuation is rapid the evacuation continues beyond this low value to allow air to be released from the goods. 11.11.77 as 850845 (13pp295)

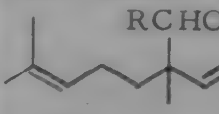
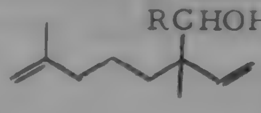
E19 (23.07.79) C07c-29 C07c-33/02 C07c-43/20 C07c-91/40

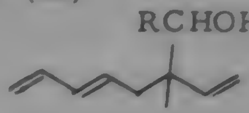
New unsatd. alcohols are of formula (I)-(III).



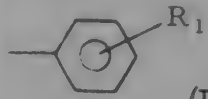
(I)



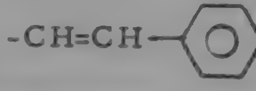
(II)



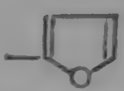
(III)



(IV)



(V)



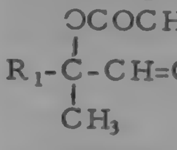
(VI)

In the formulae, R is H, $-C_nH_{2n+1}$, $-C_nH_{2n-1}$ or a gp. (IV)-(VI); n is 2-7; R_1 is H, CH_3, C_2H_5, halo, OCH_3 or $-N(CH_3)_2$. Cpds. are useful as starting material for synthesising monoterpene alcohols, i.e. linalool, geraniol and nerol.

Cpds. (I)-(III) are prepd. by reacting isoprene with an aldehyde (RCHO) (e.g. an aq. formaldehyde soln., anhydrous formaldehyde, paraformaldehyde, acetaldehyde, acrolein, benzaldehyde, etc.) in the presence or absence of a base using, as catalyst, a salt, a chelate or a coordination cpd. of palladium, pref. bis-(tri-O-tolylphosphine) palladium or a phosphine. 29.12.77 as 159522 (12pp140).

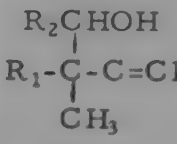
KURE ★ D23 64066B/35 ★J5 4092-912
Prepn. of mono:terpene alcohol(s) and acetic acid ester(s) - for use as intermediates to vitamin/A, vitamin/E, vitamin/K, etc. and flavourants, respectively
KUREHA CHEM IND KK 29.12.77-JA-159523
B05 E17 (B03 E13 E14) (23.07.79) C07c-29 C07c-33/02 C07c-67/08 C07c-69/14

Prepn. of monoterpene acetic esters of formula (I) or (II), useful as flavourants comprises reacting an unsatd. alcohol of formula (III) with lead tetraacetate.



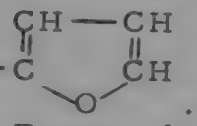
$R_1\text{-C(OCOCH}_3\text{)(CH}_3\text{)-CH=CH}_2$ (I)

$R_1\text{-C(CH}_3\text{)=CH}_2\sim\text{CH}_2\text{OCOCH}_3$ (II)



$R_1\text{-C(CH}_3\text{)(R}_2\text{CHOH)-C=CH}_2$ (III)

(R_1 is 4-methyl-3-pentenyl, 4-methyl-4-pentenyl or 4-methyl-2,4-pentadienyl; R_2 is H, $-C_nH_{2n+1}$ (n = 1-7), $-C_nH_{2n-1}$ (n = 2-7), phenyl opt. substd. by CH_3, C_2H_5, halogen, $-OCH_3$ or $-(CH_3)_2$; -CH=CH-Ph or



.

Prepn. of monoterpene alcohols useful as raw material for synthesising vitamin A, carotene, vitamin E, vitamin K, etc. partic. linalool, geraniol or nerol, 3,7-dimethyl-1,7-octadienol-3 or 3,7-dimethyl-2,7-octadienol-1; or 3,7-dimethyl-1,5,7-octatrienol-3 or 3,7-dimethyl-2,5,7-octatrienol-1, comprises hydrolysing the unsatd. acetic ester (I) or (II).

The reaction of (III) and lead tetraacetate is conducted in a solvent, e.g. naphtha, petroleum ether, cyclohexane, benzene, etc. at -20° to 100°C, pref. 10-80°C for 10 min.-20 hrs. 29.12.77 as 159523 (5pp140).

MITC ★ D23 64081B/35 ★J5 4092-947
15-Methyl-bi:cyclo(10.3.0)penta-deca-1(12)-en-13 one prepn. - by reacting cyclo-decene with an unsatd. acid over poly:phosphoric acid, useful as intermediate for perfumes
MITSUI PETROCHEM IND KK 28.12.77-JA-157325
E15 (23.07.79) C07c-49/54

15-Methyl-bicyclo[10,3,0]pentadeca-1(12)-en-13-one (I) is prepd. by reacting cyclodecene (II) with α, β-unsatd. carboxylic acid (III) at 35-50°C over polyphosphoric acid.

(I) is useful as synthetic intermediate for muscone or natural perfumes and is obtd. in high yield selectively by adopting a specific temp. Defects of known methods including low yields are overcome.

(III) includes acrylic acid, α-ethylacrylic acid, crotonic acid and β-ethylacrylic acid. A mixt. of phosphorus pentachloride and orthophosphoric acid may be available in lieu of polyphosphoric acid, because the former is convertible into the latter. 28.12.77 as 157325 (3pp104).

FRIT- ★ D23 64169B/35 ★NL 7901-164

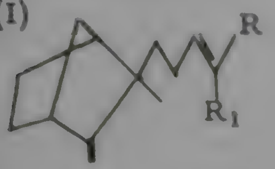
Beta:santalol, beta:santalene, di:hydro beta:santalol cpds., prepn. - by e.g. reacting camphene with manganese tri:acetate or haloacetic acid, treating with acid, reducing, etc.

FRITZSCHE DODGE & C 14.02.78-US-877759

E15 (16.08.79) A61k-07/46 C07c-13/40 C07c-31/13 C07c-33/05 C07d-315

In the prepn. of cpds. of formula (I) where R and R_1 are H or low alkyl, either (a) camphene is first reacted with Mn triacetate or a haloacetic acid in the presence of an alkali metal halide or (b) camphene is oxidised to camphene oxide (II) and the (II) is reacted with an anion contg. a gp. which makes possible the formation of a lactone- or iminolactone bridge to form β-(2-exo-hydroxy-3,3-dimethyl-2-norbornyl)-propionic acid γ-lactone (III) and the endo isomer.

(I)



Theprod. from the first stage is treated with an acid to cause intramolecular rearrangement to β-(3-exo-hydroxy-endo-2,3-dimethyl-2-norbornyl)-propionic acid δ-lactone (IV). The (IV) is reduced with a metal hydride to form β-(3-exo-hydroxy-endo-2,3-dimethyl-2-norbornyl)-propanol-hemiacetal (V). The (V) is then reacted with an alkylidene-trisubstituted phosphorane and the prod. is dehydrated to form the (I).

The process allows prodn. of β-santalene, cis- and trans-β-santalol, dihydro-β-santalol, tetrahydro-β-santalol and related cpds. from camphene. The prods. are useful intermediates and as ingredients in perfumes e.g. to impart sandalwood fragrance. 14.2.79 as 001164 (21pp513)

Conjugating non-conjugated unsatd. fatty acids - by heating with aq. alkali metal hydroxide at about autogenous pressure, giving prod. with controlled cis-trans to trans-trans ratio

SYLVACHEM PTY LTD 08.07.77-US-814139

A41 E17 G02 (14.08.79) C09f-07/08 C11c-03/14

A feedstock contg. unconjugated unsatd. fatty acids is (1) continuously charged, along with alkali metal hydroxide and water, into a flow reaction zone maintained under at least autogenous pressure; (2) heated in the zone to 200-370°C; (3) continuously with drawn from the zone when the unconjugated fatty acid value of the prod. stream is practically zero and the cis/trans to trans/trans fatty acid ratio is 0.1-50:1; (4) acidulated to spring the crude fatty acid prod.; and (5) treated to recover this prod.

A continuous flow process is provided for conjugating unconjugated unsatn. of fatty acids in which the cis/trans to trans/trans ratio of the conjugated fatty acid prod. is monitored during the reaction and such ratio of the crude prod. is controlled thereby. The process is also extremely efficient and rapid. The process is esp. for treating linoleic and linolenic acids to give conjugated fatty acids which are useful in the mfr. of alkyd paints, lacquers, varnishes, drying oils and waxes, because of the superior drying properties and good performance. 8.7.77 as 814139 (4pp914)

KAOS D23 81321A/45 =US 4164-506

Lower alcohol ester(s) of fatty acids prodn. - to give oils and fats of improved colour and improved recovery of high quality glycerine

KAO SOAP KK 17.03.77-JA-029709

*E17 (14.08.79) *J53114-806 C11c-03/02 + C09f-05/08*

Lower alcohol esters of fatty acids are produced from an unrefined fat contg. impurities including free fatty acids, polypeptides and phospholipids. The free acids are first esterified by reaction with lower alcohol in the presence of an acid catalyst. The amt. of lower alcohol present at the end of this reaction exceeds that which can be dissolved in the fat so that a two-phase prod. is obtd. comprising (1) the fat phase and (2) the lower alcohol phase which contains dissolved impurities.

The lower alcohol layer is removed to leave a refined fat. Lower alcohol and alkali catalyst are then added to the fat and interesterification, is effected to form lower alcohol esters of the fatty acids in the fat.

The fatty acid lower alcohol esters have good guality and colour and in addn. a good level of recovery of the by produced glycerol (also of high quality) can be obtd. 9.3.78 as 884835(5pp945)

Low temp. bleaching of stained or soiled fabrics is carried out using a soln. of peroxygen bleaching agent of pH 6-12 contg. a sulphonyloxime as activator. Pref. the mole. ratio of peroxide to activator is 20:1 to 1:3. Also claimed are bleaching compsns. contg. peroxy cpd., sulphonyloxime activator and buffer salts to ensure the soln. has pH 6-12, and detergent compsns. contg. 5-50 wt.% of the above bleaching compsn., 5-50 wt.% detergent and 1-60 wt.% builder.

The sulphonyloximes lower the temp. at which the bleaches are effective. 16.10.78 as 952026 (7pp955)

HENK D25 33405A/19 =US 4164-430

Machine washing and cleaning of solid articles - using baths with opt. low phosphate contents and powdered cation exchangers

HENKEL KG AUF AKTIEN 01.12.76-DT-654353

*A97 +P43 (A91) (14.08.79) *BE-860-341 B08b-07/04*

Solid soiled materials are machine washed by withdrawing and recycling the wash liquor in a washing area through a water-insol. particulate cation exchange copolymer of swelled average particle size 10-2000 µ and of Ca binding power ⩾ 2 mVal/gm. The copolymer is a (graft) copolymer derived from unsatd. carboxylic acids, and is maintained out of contact with the solid-soiled materials in a countercurrent filter (I) separate from the washing area.

The wash liquor is passed through a lint filter before passing through (I) and then recycled to the washing area to wash the materials. The total wash liquor is recycled through the cation exchange polymer, continuously or intermittently from the washing area and back ⩾ 5 times during the washing process.

The flow direction of the wash liquor through (I) is reversed repeatedly during a wash period of 30-90 mins., at intervals of 2-15 mins. The copolymer softens the washing liquor, which contains, 0.2-10 g/litre of other soluble washing and cleaning cpds. including 0.05-2 g/litre of water-soluble Ca binding sequestrant.

Used esp. for washing textiles. Process prevents clogging of the filter pores. 16.11.77 as 852029 (13pp997)

CHEM- ★ D25 64617B/35 ★US 4164-477

Conc. cleaning compsn. for treating mould and mildew - includes carboxylic acid, surfactant, zinc cpd. fungicide, wetting agent and water

CHEM-X3 INC 02.10.78-US-947537

C03 E19 (E32) (14.08.79) C11d-03/06 C11d-07/56

A conc. cleaning compsn. comprises (1) 82.4-97.0 (wt.)% water, (2) 2-10% acetic, formic, propionic, n-hexanoic, lactic, citric, n-butanoic, n-pentanoic, trimethylacetic, methosyacetic, cyanoacetic, chloroacetic or tartaric acid, (3) 0-0.8% of penetrant chosen from alkanolamide detergents and Na salts of EDTA, (4) 0-0.8% of Na tripolyphosphate, (5) 0.1-10% of surfactant chosen from high alkyl mononuclear aryl sulphonates, alkyl polyethoxamer deter-gents, alkanolamine detergents and alkanolamide detergents, (6) 0.2-2.0% of fungicide chosen from Zn-sulphate, -bromate, -acetate, -bromide, -chloride. -iodide, -nitrate, and -chlorate, (7) 0.05-1.0% of wetting-dispersing agent consisting of the condensn. polymerisation prod. of polyglycerol with phthalic anhydride, and (8) 0-2.0% of Na metasilicate degreasant.

The compsn., when added to water and an oxidising agent, produces a reaction mixt. capable of killing and removing and preventing the regrowth of mould and mildew. It can be used on a variety of surfaces including stone.

brick, stuces, exterior wood, exterier painted surfaces, tile, ceramics, metal, plastics, automobile tyres, shower walls, refrigerators and boats. It can also be applied easity, e.g. using a garden sprayer. Typically surfaces can be protected for up to 2 years. 2.10.78 as 947537(6pp914)

LIOY D25 69287A/39 =US 4164-478

Detergent granules contg. surfactant, silicate and carbonate builder - which are coated with finely divided, inorganic, water-insoluble cpd.

LION FAT & OIL KK 18.03.77-JA-029269

*E37 (14.08.79) *DT2811-543 C11d-11 +C11d-01/12 C11d-03/12*

Detergent granules contg. 10-40 wt.% of an organic water-sol., anionic synthetic surface active agent, 4-20 wt.% of a water-sol. alkali metal silicate and 2-40 wt.% of a water-sol. alkali metal carbonate, are treated such that the reaction between the alkali metal silicate and the CO_2 in the ambient atmos. is inhibited.

The treatment comprises mixing 0.3-5 wt.pts. of a powder of water-insol. MgO, $Al(OH)_3$, $CaCO_3$, heavy white carbon and titanium oxide with the preformed granules, the granules being of average particle dia. ⩽ 1.5 µ. The powder is thus adhered to the surfaces of the granules in the form of an external covering.

The compsn. reduces the adhesion of water-insol. substances onto washed cloth at the time of washing.

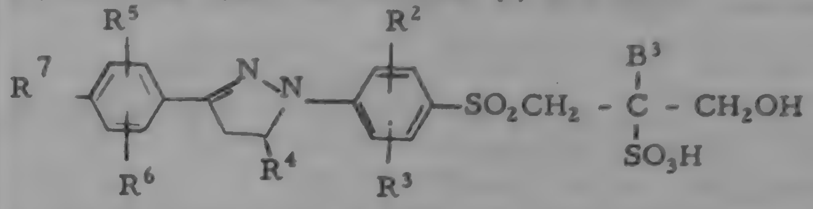
BADI D25 22679Y/13 =US 4164-500

Novel pyrazoline cpd.

BASF AG 11.11.75-DT-550548 (31.07.75-DT-534180)

*A60 E13 F06 (14.08.79) *J52021-031 C07d-231/06*

Pyrazoline cpds. of formula (I) are new.



(I)

In the formula B^3 is H or 1-4C alkyl. R^2, R^3, R^5, R^6 and R^7 are H, Cl, Br, F, (m)ethyl or (m)ethoxy. R^4 is H, 1-4C alkyl, benzyl, phenethyl, phenyl opt. substd. by Cl, Br (m)ethyl, (m)ethoxy, -CN or hydroxysulphonyl. Pref. B^3, R^2, R^3, R^4, R^5 and R^6 are H and R^7 is Cl.

The cpds are used as optical brighteners for cellulose esters and partic. for acrylonitrile polymers, wool and polyamides, esp. in liquor dyeing. Brilliant white effects are obtd. having good fastness properties. In addn., the cpds. are used in detergents for brightening paper.

CPI INDEXES

ALERTING PATENTEE INDEX (II)

Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

In Basic Abstracts Journal only

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX 1

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240	
PCT	40	
Research Disclosure	20	
South Africa	100	
Sweden	260	
United Kingdom unexamined	600	3325

Slow publishing

Japan examined	340*	
Netherlands examined	60	
Soviet Union	1200	
Switzerland	260	
United Kingdom examined	300	
United States	1200	4375

*Only CPI coverage for Japan.

"Minor" Countries

Complete coverage, but only introduced during 1975, with exception of Italy 1978.

Fast publishing

Brazil	140	
Denmark	120	
Finland	60	
Norway	80	
Portugal	30	430

Slow publishing

Austria	125	
Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

NEWSLETTER

17th October 1979

1979 No. 19

* 1. 1980 BROCHURES AND ORDER FORMS

Sets of brochures and order forms which were sent out at the end of September should by now have reached all subscribers; a further set of Order Forms is enclosed with this Newsletter.

Additional copies are available on request from our Washington Office (for United States Subscribers), from Nippon Gijutsu Boeki (for Japan) or from our Subscription Department (for all other countries).

To ensure continuation of your subscription and the incorporation of any changes for 1980 you are urged to submit completed order forms as soon as possible. Should you require advice or information please do not hesitate to contact us.

* 2. ELECTRICAL PATENTS INDEX

Plans for Derwent's new service "Electrical Patents Index" (EPI) are now at an advanced stage with the first issue scheduled for January.

An advance copy of the EPI Users Manual and a further copy of the World Patents Abstracts brochure are being despatched to all subscribers this week. Further copies and additional information may be obtained from Derwent in London.

Copies for Japanese subscribers are being despatched this week in bulk to Nippon Gijutsu Boeki for onward mailing to subscribers.

3. 1979 CENTRALISED INSTRUCTION CLASSES

Centralised Instruction Classes in Washington DC will shortly be held as detailed below.

In recent weeks a large number of new requests and alterations to previous requirements have been received. These are being acknowledged in writing, but should notification not arrive in time delegates can safely assume that they may attend. For this reason details of location and times are given here.

WASHINGTON D. C.

Holiday Inn National Airport, 1489 Jefferson Davis Highway,
Arlington, VA. 22202. Tel. (703) 521-1600.

Monday Oct. 22nd	IC3	Introductory Coding Sections BCE
Tuesday Oct. 23rd	IC5	Coding & Retrieval Sections BCE
Wednesday Oct. 24th		
Thursday Oct. 25th	IC9	Online Instruction Sections BCE
Friday Oct. 26th	IC10	Online Instruction (Except Sections ABCE)

Olde Colony Motor Lodge, North Washington and First Streets, Alexandria, VA 22313 Tel. (703) 548 6300. Contact Areli Ann Woody

Monday Oct. 29th	IC2	Introductory Coding Section A
Tuesday Oct. 30th	IC4	Coding & Retrieval Section A
Wednesday Oct. 31st		
Thursday Nov. 1st	IC8	Online Instruction Section A
Friday Nov. 2nd	IC1	General Instruction

Sheraton National Motor Hotel, Columbia Pike and Washington Blvd., Arlington VA 22204. Tel. (703) 521 1900.

Monday Nov. 12th	IC7	Advanced Coding & Retrieval Sections BCE
Tuesday Nov. 13th		
Thursday Nov. 15th	IC6	Advanced Coding & Retrieval Section A
Friday Nov. 16th		

Cost for centralised classes will be £20 ($50) per person per day except for online classes where the costs are £30 ($75) per attendee per day. Classes will commence at 9.00 a.m. on each day. Participants are asked to bring their own copies of relevant Instruction Manuals for use at these classes.

*4. U.S. OFFICE

Mr. Christopher Medcalf, Assistant Marketing Manager is at present available in our U.S.A. Office to answer subscribers' queries until Friday 2nd November. From Monday 5th November to Friday 16th November Dr. Brian Gore, Marketing Manager, will replace Mr. Medcalf.

Subscribers are reminded that the address of our USA Office is Suite 605, 1735 Jefferson Davis Highway, Arlington, VA 22202, telephone number (703) 521 7977, telex number (international only) 248416 DERW.

5. PORTUGUESE IPCs

The Portuguese Patent Office has commenced to assign International Patent Classes to its patents, starting with those published 20.9.79 (Derwent Week B41). Research Disclosure abstracts are now the only "country" which does not assign IPCs.

*6. NEW CHEMICAL CODE

Full details of Derwent's proposals for the new code were circulated to all members of Subscriber Committee No. 5 at the beginning of September. Their comments and suggestions are now being collated, and these will be discussed at the next meeting of the Coding sub-committee which will be held on the 25th to 26th October in London.

*7. MAGNETIC TAPE PRODUCTS 1980

A new Instruction Manual - No. 7 - has just been printed and a copy sent to all existing subscribers to magnetic tape products. This gives a full description of the tape products available in 1980 which, in several ways, differ from those available previously.

A limited number of further copies are available, on request, from our Data Processing Division.

* 8. PLASDOC (CPI SECTION A) KEYTERMS

We have to announce that due to a fault in computer processing, all Plasdoc Multipunch, Key Terms and Key Serials as applied from Week B06 to date are suspect.

All Punch Codes and Terms generated by Key Serials 2698-2857 (that is, 'Applications') since 09948B are missing from both online files (SDC and InfoLine) and from the Multipunch Search Files.

We are doing all we can to restore the data as soon as possible, but in the meantime, all searches done in the last 2/3 months involving these concepts should be treated with suspicion for 1979 (B series) Accession Numbers.

* 9. WPI ONLINE FILE POSITION

	Loaded to	Awaiting Loading at SDC
Basics/Equivs.	B31 (7907)	B32-B35
Manual Codes	B29 (7906)	B30-B33
Multipunch A*	B18 (7904)	B10-B22
Plasdoc Key Terms*	B10 (7903)	B11-B13, B14-18, B19-B22
Multipunch B, C, E	B17 (7904)	B18-B21, B22-B26

*N.B. Item 8.

SDC have experienced severe hardware problems in the last 2 weeks, and this accounts for the delay in processing outstanding updates. All the above are expected to be cleared by the time this Newsletter is received.

BASIC SUBSCRIPTION

Full Basic Subscription to any Section gives the right to receive any CPI material, **marked with or without an asterisk**, relating to that Section, except Item 7 where a 10 unit minimum is required

Partial Basic Subscription to any Section gives the right to select only material which is **not marked with an asterisk**, i.e. Alerting Bulletins, certain printed and COM Indexes and/or Complete Specification Microfilm relating to that Section

Completion of Table I: Against any Section required, mark in Column Z whether Partial or Full Basic Subscription is required by repeating the number of Basic Units shown in Column Y in the corresponding box in Column Z.

Conversion of Basic Units to Annual Basic Subscription Cost From the total number of Basic Units at the foot of Table I read off from Table II the annual Basic Subscription Cost and enter it in the space provided. Items marked § are also included on the 1980 WPI Order Form.

Conditions of Use of CPI and terms of Payment are described on the back of this order form

Conditions of Use

Because of the special price structure of CPI, and the wide subject coverage, which often extends beyond the requirements of any one unit of a Corporation, it is necessary to impose special restrictions on the distribution and use of CPI material.

Subscribers may only use and distribute CPI material within their own organization, and may not pass any CPI material on to a separately housed Division or subsidiary Company, whether located in the same country or overseas, without permission from Derwent.

A foreign or domestic affiliate of a CPI subscriber requiring direct mailing and recognition, may subscribe as an Associate, paying one half of the appropriate Basic Subscription.

Payment

Payment of Subscriptions may be made quarterly in advance, against separate invoices.

Requirement Amendments

Amendments to the material requirements of subscribers can normally only be made effective from the start of each quarter of the year and it is necessary to give at least five weeks notice of any such change of requirements.

8 PROFILE BOOKLETS REQUIREMENTS

	TITLE	No. of copies
1	Monomers, condensants	
2	Polym, catalysts, processes	
3	Nat. polymers, polymer forms	
4	Addition Polymers I

15	Steroids: Natural Products	
16	Heterocyclics	
17	Organo-Si, P, metallics	
18	Organic dyestuffs	
20	Fuels, lubricants, etc.	
21	Catalysis	
21A	Manual Code Cards for Profile 21	
	TOTAL	

23 MAGNETIC TAPES

Subscribers will receive magnetic tapes, either weekly or monthly as preferred, containing all the data files to which they are entitled.

Subscribers will thus receive the bibliography and text edited title terms files plus the manual code file if the CPI Basic Subscription is at least 4 units (this file may be received by Subscribers with fewer than 4 units by special arrangement). Additionally the multipunch files will be supplied for those sections to which the Subscriber is entitled.

Mailing Address ____________________

Edition ________ Date ________

Mailing Code ☐ E ☐☐☐☐

Invoicing Code ☐ E ☐☐☐☐

Invoicing Address if different ____________________

Invoice Number ____________________

Basic subscription to any one of the six sections costs one unit. It gives entitlement to receive free of charge one copy each of the appropriate sectional EPI Bulletin (Country Order), EPI Bulletin (Classified) and Manual Code Cards. It also gives entitlement to access the EPI Online Database, and purchase Profile Booklets within that section.

There is a sliding scale of charges for units as follows:–

No. of Units	Annual Cost in £
1	500
2	900
3	1300
4	1650
5	2000
6	2300

Additional copies of any materials may be purchased at £50 per set, per annum. Profile Booklets as listed overleaf cost £12 per annum each.

In the order form below please indicate in the first column if a Section is required by inserting 'yes or 'no'. Then in the remaining column enter the number of any additional copies required. Finally complete the additions, and enter the value of your subscription.

		BASIC SUB. REQUIRED AT ONE UNIT EACH YES/NO	NUMBER OF ADDITIONAL COPIES AT £50 EACH PER COPY		
			EPI BULLETINS		MANUAL CODE CARDS
			COUNTRY ORDER	CLASSIFIED	
S	Instrumentation, measuring and testing				
T	Computing and control				
U	Semiconductors and electronic circuitry				
V	Electronic components				
W	Communications				
X	Electric power engineering				
		TOTAL UNITS	TOTAL NO.	TOTAL NO.	TOTAL NO.

Total Basic Subscription Units ☐ = £ ☐

Total Extra Copies ☐ = £ ☐

Total Profile Booklets at £12 each (See over) ☐ = £ ☐

TOTAL ANNUAL SUBSCRIPTION £ ☐

Quarterly Subscription Cost: ________

Change compared with previous edition: ________

DERWENT PUBLICATIONS LTD Rochdale House 128 Theobalds Road London WC1X 8RP England

Conditions of Use

Subscribers may only use and distribute EPI material within their own organization, and may not pass any EPI material on to a separately housed Division or subsidiary Company, whether located in the same country or overseas, without permission from Derwent.

A foreign or domestic affiliate of an EPI subscriber requiring direct mailing and recognition, may subscribe as an Associate, paying one half of the appropriate Basic Subscription.

Payment

Payment of Subscriptions may be made quarterly in advance, against separate invoices.

Requirement Amendments

Amendments to the material requirements of subscribers can normally only be made effective from the start of each quarter of the year and it is necessary to give at least five weeks notice of any such change of requirements.

PROFILE BOOKLETS REQUIREMENTS

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.
AE	Polymer & General Chemistry

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

PATENTS ON MICROFILM

For a number of countries, we film every patent specification in numerical sequence using a flat bed camera at 24:1 reduction ratio. The 200 ft. polyester diazo negative 16mm reels are second generation from a negative silver master. They are despatched weekly by airmail, shortly after the specifications are published.

A list of the available films is shown below, giving number of reels per country per year, annual costs as from 1st January 1980, and the dates from which film is available. Backlog film can be made available at the same annual costs as for the current year.

Please address orders and enquiries to the PATENTS SUPPLY DIVISION.

This sheet may be used as an order form for both current and backlog orders.

PATENTS COPY SERVICE

The Patents Supply Division has been organised to give an extremely rapid turnround at low prices. The schedule of prices and turnround times, together with the methods of ordering and payment, is given below.

SCHEDULE OF PRICES AND TURNROUND TIMES AS FROM NOVEMBER 1979.

COUNTRY	DELAY from receipt of order within:	COST inclusive of (airmail) postage	SURCHARGE if applicable	NOTES
BELGIUM EUROPE PCT	1 day	per page £0.11, $0.29 or Y84	—	Photocopies
FRANCE	2 weeks	per patent £1.55, $3.60 or Y950	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
GREAT BRITAIN	2 days	per patent £1.30, $3.00 or Y820	—	Printed copies
JAPAN	4 days	per patent £0.95 or $2.20	—	Photocopies
NETHERLANDS	1 week	per patent £1.50, $3.45 or Y860	1p, 2c or 8Y per page if more than 20 pages	Printed copies
SOUTH AFRICA	3 weeks	per page £0.27, $0.60 or Y170	Minimum charge equivalent to 5 pages	Photocopies
UNITED STATES	4 days	per patent £1.25, $2.30 or Y770	11p, 20c or 70Y per page if more than 15 pages	Photocopies
WEST GERMANY	2 weeks	per patent £1.65, $3.90 or Y1,000	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
CANADA SWITZERLAND EAST GERMANY SOVIET UNION	4 days	per page £0.17, $0.45 or Y110	Minimum charge equivalent to 5 pages	Photocopies

* Copies of specifications can now be supplied for Austria, Brazil, Denmark, Finland, Hungary, Israel, Italy, Norway, Rumania and Sweden. Prices comprise actual costs plus a nominal handling fee. *

METHOD OF ORDERING

(i) By books of standard order forms available upon request, or

(ii) By letter, or

(iii) By telex, to cut postal delay. French and West German patents ordered by telex are processed as rush orders at double normal cost (see NOTES above) unless normal service requested.

METHOD OF PAYMENT

(i) On receipt of bi-monthly invoices, or

(ii) By charges against deposit accounts. Subscribers are encouraged in their own interest to open deposit accounts with us so as to avoid the need for frequent payments.

Please address orders and enquiries to the Patents Supply Division.

UPE- ★ D11 64747B/36 ★BE-875-757
Continuous electric oven for cooking pizzas on plates - has loading
nd discharge stations accessible to single operator at front of oven
SUPERFORNI RINALDI 08.05.78-IT-023124
Q77 (16.08.79) A21b F27b

A continuous conveyor transports loaded plates successi-
vely through the cooking chamber. The conveyor has sta-
tions for loading uncooked pizzas and discharging cooked
pizzas, both stations being accessible from the outside of
the oven.

The conveyor has horizontally moving paddles which displace the plates along horizontal slide rails extending longitudinally through the oven chamber. The oven has a single access opening in its front wall through which the conveyor extends presenting both loading and discharge stations, side-by-side. The paddles are pref. curved to fit around the driven side of each plate. The plate is automatically disengaged from its driving paddle when the paddle passes through the discharge station, e.g. by a lifting cam

Bath loading and discharge stations are accessible from a single operator posn. at the front end of the oven. Each paddle can be maintained individually without dismantling the oven. The oven can be adapted for different capacities by modular extension. 20.4.79 as 875757 (17pp448)

DROU/ ★ D11 64932B/36 ★DT 2907-129
Loading and unloading trolley for multistage baking oven - has endless metal belts actuated by catches on shelves
DROUET J C 22.02.78-FR-005126
(30.08.79) A21b-03/07

A trolley with a number of support surfaces for bread and other articles of dough, in stages one above the other, works with an oven having a number of shelves, so that each support surface can be pushed into a position immediately above a shelf in the oven. Each support surface consists of an automatic loading arrangement formed by an endless sheet metal belt, running on end rollers, and in each stage of the oven there are means of blocking the endless belt and of starting it running so that the products on the belt are deposited on to the oven shelf, as the trolley is withdrawn.

Reduces considerably the manual work necessary for transferring the lumps of dough from the rising chamber into the multi-stage oven, so that practically all the hand-work between rising chamber and oven is eliminated. 22.2.79 as 907129 (23pp1045)

UNBI- ★ D11 65086B/36 ★GB 2014-838
Patterned or textured crisp:bread prodn. - by whisking to a pourable and/or spreadable mixt. and cooking between two patterned plates
UTD BISCUITS UK LTD 02.02.79-GB-003744 (23.02.78-GB-007184)
(05.09.79) A21b-05

An edible prod. is prepd. from a batter of water, cereal meal(s) and colourant(s) and/or flavourant(s), which is vigorously agitated to form a homogeneous mixt. of pourable and/or spreadable consistency. The mixt. is then placed between a closed pair of spaced plates or onto one of an open pair of such plates, which are then closed. The viscosity of the mixt. is such that it spreads over all the inner surface of ≥1 plate, and it is used in such an amt. that it fills the space when cooked, due to heating of the plates.

The process gives a crispbread which can have the same or different pattern on each side. It is quick, simple, and economic, and treats both sides of the crispbread similarly. 2.2.79 as 003744 (5pp976)

DAII ★ D11 65662B/36 ★J5 4095-987
Powdery foaming agent for food industry - contg. glycerine ester of fatty acids part of which should be unsatd. acid
DAIICHI KOGYO SEIYAKU 12.01.78-JA-002525
(28.07.79) A21d-02/16 C09k-03

A powdery foaming agent (I) contains glycerin ester (II) of fatty acids, 5-50 wt.% of which should be unsatd. fatty acid.

(I) is foaming agent used for food industry. Other known edible (I) are pasty and uniformly mixing of these (I) with other materials is difficult. The present (I) has stable foaming power for long periods.

The average iodine value of (II) should be 5-50, and (II) should be composed of 50-95 wt.% of (II) having iodine value <3 and 50-5 wt.% of (II) having iodine value 70-120. One or more sucrose fatty acid esters, sorbitan fatty acid ester, propylene glycol fatty acid ester and lecithin other than (II) is/are pref. added in (I) as surfactant. Pref. compsn. of (I) is 5-30 wt.% of surfactant, 70-95 wt.% excipient, such as mono-, di- and polysaccharides, decomposition-prod. of sugar alcohol and starch and protein, and 0.1-2 wt.% of casein sodium. 12.1.78 as 002525 (2pp42)

FORT- D11 17374S/10 #NL-161-038
Strand dough divider knives
VEB KOMB FORTSCHRIT (LAND-) 20.08.69-DL-141958 (03.03.70-NL-003051)
*(15.08.79) *DT2023-841 A21c-05*

Small pieces are cut from a band of dough fed from rollers by means of a cutting knife which is mounted in a guide frame in which it can execute an extending and retracting motion whilst the frame itself is hinged and can execute a swinging motion. The sliding motion is operated by a cam at the back end of the blade, the cam being incorporated in a rotary mechanism which also causes the swinging motion of the frame.

The arrangement is such that the tip of the blade executes an inward motion toward the axis of the roller over which the dough is moving and which forms the backing plate for the cut and then swings downward to release the piece of dough before being retracted.

This movement prevents the dough layer from being disturbed during the cutting action of the knife so that further operations are not adversely affected. 3.3.70 as 003051 (6pp1370)

IVAN= ★ D11 65947B/36 ★SU-635-042
Ammonium carbonate prodn. for bread, fertilisers etc. mfr. - by mixing ammonia, carbon di:oxide and ammonium carbonate soln. and particles
IVANOVO CHEM TECH 13.06.75-SU-143657
C04 E35 (04.12.78) C01c-01/26

$(NH_4)_2CO_3$ used in bread baking, in colouring, and in fertiliser prodn., is obtd. in solid form with NH_3 content of 30-32% and water content 12-14% by mixing NH_3, CO_2 and an aq. soln. of $(NH_4)_2CO_3$ in presence of solid $(NH_4)_2CO_3$ particles.

The solid $(NH_4)_2CO_3$ particles are used in wt. ratio with NH_3 and CO_2 of 3-30:1 and aq. soln. $(NH_4)_2CO_3$ as 0.5-0.8 wt. of NH_3 and CO_2.

The water content of prod. stabilises it in storage and in transit.

Shlyakhtov V.G., Gogolev Yu.G., Streltsov V.V. Bul. 44/30.1.78. 13.6.75 as 143657 (2pp1347)

UFOO= ★ D11 66140B/36 ★SU-635-944
Dough dividing machine for bread baking industry - has feeding and delivery roller pairs and measuring containers, filled with dough from parts of roller surface enclosed by collars
UKR FOOD MECH ENG 06.06.77-SU-496023
(15.12.78) A21c-05/04

Dough-dividing machine, for making lumps of equal mass in bread baking comprising a loading hopper, dividing head with measuring containers, and feeding and delivery rollers positioned with a gap relative to the containers, to allow the sheet of dough to pass through.

Operational reliability of the machie is increased and more precise dividing of the dough is guaranteed by putting circular collars on the surface of at least one of the feeding rollers. The distance between any two rows of collars does not exceed the width of the measuring container.

Zolotov E.B., Mnyshenko N.A., Bul. 45/5.12.78 6.6.77 as 496023 (3pp29)

BAKE= ★ D11 66141B/36 ★SU-635-945

Spiced-biscuits finishing prodn. line - has distributing device between sugar coating drum and prod. drying conveyor

BAKERY WKS NO 10 04.02.77-SU-450320

(15.12.78) A21c-15

Flow line for finishing spiced biscuits, comprising a glazing drum, mesh conveyor for drying, cooler for holding the biscuits in holders, and discharging mechanism.

The line is more completely mechanised and the quality of the biscuits is increased by interposing a distributing mechanism between the drum and the drying conveyor. This mechanism can perform an oscillating motion. A rotating bladed drum is also positioned between the conveyor and the cooler. Each of the holders in the cooler consists of a mesh cradle, the front end of which slopes at an angle of 45-55°. The discharging mechanism comprises combs mounted so that they can interact with the cradles.

Fish descaling apparatus - has rotary drum carrying resiliently mounted arcuate cutting elements of star-shaped cross/section
AZOV-CHERNOMORSK 14.07.77-SU-511240
(30.11.78) A22c-25/02

Appts. as described in Parent Patent Cert. No. 388727 comprises a conveyor and paired spring-loaded drive drums with fish-shaped recesses. The drum surfaces carry staggered projecting clips with rounded working edges and resting on shock absorbers. To provide improved cleaning, the working part of each clip is arcuate and has star-shaped cross-section.

The appts. is effective for fish with small densely packed scales such as sea trout and pike perch. The clip arc radius of curvature is 3-18 mm and the star section points form cutting edges. Fish are fed tail-first to the drum, where the clips raise the scales and clip curvature facilitates lateral cutting and removal.

Gravity pressure extrusion to mfr. blocks of cheese from curds - under vacuum pressure temporarily relieved to prevent sticking during extrusion

ALFA LAVAL AB 20.04.78-GB-015749

P13 (16.08.79) A01j

Curds are loaded into the top of a hollow, perforated column. The wt. of curds compacts curds in the lower part of the column and drains compacted curds by squeezing moisture through the perforations. The compacted curds is extruded from the lower end of the column and cut into blocks. The column is contained in a vaccum chamber.

Each time curds is extruded from the column, pressure in the vacuum chamber is temporarily raised. This comprises slightly the mass of curds sliding down the column so that the cross-section of the mass is slightly reduced. After extrusion, pressure in the vacuum chamber is again dropped below atmospheric as the column is refilled with curds.

Used to mfr. blocks of natural cheese, e.g. cheddar. Economic, high speed production at a much faster rate than forming in individual moulds. The reduction in cross-section during raised pressure ensures that the mass of curds does not stick in the cylinder during extrusion, with danger of breakage of chesse. 20.4.79 as 875724 (24pp448)

Rapid, high yield thaumatin extraction - from dried, comminuted, separated fruit arils using acidic water
TATE & LYLE PATENT 01.03.78-GB-008111
(05.09.79) A23l-01/22 C07g-07
D/S: E(BE, CH, DT, FR, IT, LU, NL).

Thaumatin is obtd. by skinning the fruit of Thaumatococcus daniellii, drying the pulp, mechanically separating the arils from the remainder of the fruit, powdering or otherwise comminuting the dried arils, and extracting the powder with water in the absence of added salts, while maintaining the pH at 2.0-4.5, pref. 2.5-3.5, esp. 2.7-3.

The protein sweetener, thaumatin, can be rapidly extracted in a high yield. It may be isolated in high purity by ultrafiltration and freeze-drying of the extract, and is free of salts.

Continuous prodn. line to mfr. processed cheese - cooks with live steam injected into pressurised mixt. of raw materials
KRAFTCO INC 02.09.75-US-609520
*P13 (15.08.79) *BE-845-717 +A23c-19/12*

Continuous in-line mfr. of processed cheese comprises blending a cold mix at ambient temp., passing through heating and mixing zones until a homogeneous melt, and transferring to a chamber at pressure lower than in the mixer to cool, deaerate and reduce moisture content.

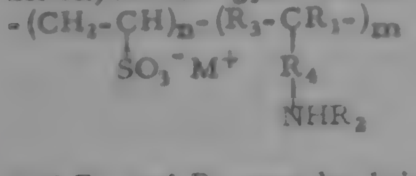
The heating zone includes a steam injection line within a housing, the mix passing between conduit and housing. The melt is pref. at 165-300°F. after leaving the mixer and is cooled to 150-210°F. in the chamber. The mixer pref includes a static mixer and a strainer, and a valve between mixer and chamber establishes a 4-10 psig. pressure on the melt. 23.8.76 as 035016 (9pp1358)

DYNL D13 27183Y/16 =GB 1550-490

Ethyl sulphonate-alkylamine copolymers - as trunks for water-soluble polymeric dyes for foods, drinks, medicaments, textiles, plastics, etc.

DYNAPOL 08.12.75-US-638731
*A14 B07 E24 (15.08.79) *BE-849-194 A23l-01/27 C08f-226/02 C08f-228/02*

Copolymers comprise repeating vinylsulphonate and 2-6C alkenylamine gps. Pref. copolymers have formula:



$$-(CH_2-\underset{SO_3^-M^+}{\underset{|}{CH}})_n-(R_3-\underset{\underset{NHR_2}{|}}{\underset{R_4}{\underset{|}{C}}}R_1-)_m$$

where R_1 and R_2 are H, or 1-4C alkyl; R_3 is 1-4C alkylene; R_4 is a direct bond or 1-4C alkylene; where R_1, R_2, R_3 and R_4 together contain ⩽5C, and R_2 and R_3 may be joined to form a 1-4C alkylene gp.; n and m are integers such that m+n = 20-8000 and n = (0.4-2.5) m; and M is alkali metal. The alkylamine unit is esp. ethylamine and the alkali metal, Na.

The copolymers are excellent backbones for water soluble polymeric colourants. They impart high degree of water solubility while contributing min. wt. to the polymer. Such colourants are used for colouring fibres, inks, paints, foods, drinks, medicines, etc. When of appropriate mol. wt., they will pass through the gastrointestinal track without breakdown or absorption. 24.11.76 as 049020 (12pp945)

RANG D13 07588Y/05 =GB 1551-727

Meat and fish substitutes with a fibrous layered structure - by extruding compressed protein mass and forming into layers

RANK HOVIS MCDOUGAL LTD 25.05.76-GB-021620 (17.09.75-GB-038195)
*(D12) (30.08.79) *BE-846-288 A23j B29f-03 +B29c-24*

Proteinaceous masses are formed into fibrous and layer structures similar to meat or fish, by moving the mass in a helical and at the same time compressing the mass to form a fibrous structure, extruding the compressed mass through an elongate slot, and changing the direction of movement of the extrudate to form folds to give a layered structure. Compression and extrusion are both at elevated temps.

Alternatively, the slot is annular and the extrudate emerges into an opening radially of the slot so that folds are formed. The appearance of meat or fish can be simulated using soya. 27.8.76 (19pp1376)

Powdered emulsifying foaming agent - prepd. by adding edible surfactant and beta cyclodextrin to sugar(s) and/or sugar alcohol while in molten state, then cooling

DAIICHI KOGYO SEIYAKU 05.01.78-JA-000402
(24.07.79) A21d-02/14 C09k-03

Powdered emulsifying foaming agent is claimed suitable fo use in the prodn. of food and drink, esp. confectionery, exhibiting excellent water solubility and rapid foamability. Emulsifying foaming agent is prepd. by adding an edible surfactant e.g. sucrose-fatty acid ester (the fatty acid has 8-22C and iodine value of <25) and beta-cyclodextrin to sugars and/or sugar alcohol, maintaining under melted state, followed by cooling and pulverisation.

In an example, 79.8 pts. wt. fine granulated sugar and 10 pts. wt. sorbitol were added to water and heated at 80°C. so as to be dissolved, after which 10 pts. wt. of an activating compsn. comprising 50% hardened beef tallow fatty acid glyceride, 40% sucrose-palmitic acid ester and 10% sorbitan monostearate and 0.2 pts. wt. beta-cyclodextrin were added under agitation at 125°C. followed by instantaneously cooling-down to room temp. to solidify them and pulverisation to give the prod. 5.1.78 as 000402 (2pp34)

MEIP ★ D13 65615B/36 ★J5 4095-745

Simultaneous refining of lactose and casein - by treatment with granular active carbon

MEIJI MILK PRODS KK 11.01.78-JA-001198
(D17) (28.07.79) A23j-03 C13k-05

The method comprises mixing aq. crude lactose soln. and aq. unrefined casein soln. and treating the mixt. with granular active carbon at 45-65 pref. 50-60°C. When the refining is interrupted, the aq. lactose soln. having a concn. >30 w/w% is pref. recirculated through the column of granular active carbon to prevent the putrefaction.

Lactose and the casein which are originated from milk and are often used together in foods, can be refined simultaneously while preventing the Maillard reaction and preventing putrefaction during interruption of the refining. Thus refining costs are reduced.

Suitably lactose and casein are previously converted to aq. 20-50 w/w% soln. and aq. 5-13 w/w% alkaline soln. respectively and prior to the refining they are mixed in the proper proportions. 11.1.78 as 001198 (4pp5)

DAII ★ D13 65617B/36 ★J5 4095-748

Sucrose fatty acid ester compsn. - prepd. by dispersing or dissolving stabiliser, sucrose fatty acid ester and sugar, dextrin and/or sugar alcohol in water, and spray-drying

DAIICHI KOGYO SEIYAKU 12.01.78-JA-002526
E13 (28.07.79) A21d-10/04 A23d-05 A23l-01

Compsn. is prepd. by dispersing or dissolving (a) sucrose acid ester (I); (b) sugar, dextrin and/or sugar alco- and (c) stabiliser in water, and spray-drying the dis- sion or the soln.

Compsn. has good water dispersibility and can be used ectly without complex pretreatment. Compsn. is pow- , can be easily handled and is storage stable.

tabiliser is e.g. casein sodium gelatin, sodium argin- gum arabic etc. (I) pref. is prepd. from 12-22C satd. y acid and has HLB value >10 and is pref. present in compsn. as 5-30 w/w%. 12.1.78 as 002526 (2pp5)

mproving the quality of denatured defatted soybean protein - by orming aq. slurry, extruding, pulverising the protein granules and assing through a pipe at a specified temp.

AJINOMOTO KK 10.01.78-JA-001454

(28.07.79) A23l-01/20

he method comprises (1) extruding the aq. slurry of the efatted soy bean which is previously denatured with heat nd/or alcohol, in pipe line through orifice under pres- ure, (2) thus pulverising the protein granules of defatted soy bean and (3) flowing it at <110°C. through the pipe ine.

The water solubility of denatured soy bean protein can be restored by treating the aq. slurry of denatured de- fatted soy bean under moderate condition and from it the separated soy bean protein can be obtd. with a yield equal to that attained by undenatured defatted soy bean. Excel- lent gel property can be attained.

Denatured defatted soy bean is made aq. slurry with 4- 20 times amt. of water and it is desirable to regulate pH of the aq. slurry to 6.5-9.0 favourably 7.0-8.0 with edible alkali for attaining better quality-improving effect. It is also desirable to add reducing agent such as sodium bi- sulphite, etc. or surfactant such as sucrose fatty acid ester, lecithin, etc. 10.1.78 as 001454 (5pp5)

SUGY ★ D13 65620B/36 ★J5 4095-762

Prepn. of fried bean curd used as instant noodle - from highly denatured defatted soybean by immersing in aq. sulphite soln., extracting protein, coagulating, etc. and frying

SUGIYAMA SANGYO KAG 09.01.78-JA-001040

(28.07.79) A23l-01/20

Curd is sepd. by (a) immersing the highly denatured defatted soy bean previously crushed to above 60 mesh and having NSI <30, in an aq. soln. of the sulphite, of which amt. is 0.1-0.5 w/w% on the defatted soy bean, (b) adjusting pH of the immersing soln. to 1-3 with acid to extract protein, (c) IEP-coagulating protein by adjusting its pH to 4.0-4.5 with alkali and (d) dehydrating the coagulated protein. The dough for fried bean curd is prepd. by combining starch or grain powder, of which amt. is 20-40 w/w% on dry solid of the sepd. curd, and $NaHCO_3$, of which amt. is enough to make pH of the sepd. curd 5.5-7.0, in the sepd. curd and kneading the mixt. The dough is moulded and fried

The fried bean curd which has tough structure and can retain its shape during its processing, is prepd. cheaply in high yield from highly denatured defatted soy bean of NSI <30. 9.1.78 as 001040 (3pp5)

SNOW ★ D13 65621B/36 ★J5 4095-768

Synthetic milk with similar protein content to human milk - is prepd. by sepg. the casein from an. aq. soln. of its alkali metal salt, and adding to protein, sugar, fat, minerals, vitamin(s) etc.

SNOW BRAND MILK PRODUCTS 11.01.78-JA-001078

(28.07.79) A23c-09/10

The method comprises (a) cooling an aq. soln. contg. alkali metal salt of casein, of protein concn. 0.5-6% and pH 7-10, to 0-15°C. (b) adding divalent cations to the soln., (c) sepg. the caseinate ppte., (d) sepg. the casein from the residual soln. and (e) using thus sepd. casein with protein, sugar, fat, mineral, vitamin, etc.

The milk has a similar protein content as human milk and can be given to children. The casein mixt. can be easily and inexpensively fractionated and a fraction of mainly β-casein and κ-casein can be obtd. 11.1.78 as 001078 (7pp5)

Organic waste material is sterilised by heat from a warm air stream. The vapour issuing from the waste matter is recirculated through the burner producing the heat so that some of the heat is obtained from the combustion of the waste gases. The process is pref. carried out in an air tight vessel with a horizontal cylindrical floor and a double wall, the outer wall being insulated and the inner wall being heat conducting.

The intermediate space serves as a circulation duct for the warm air and is equipped with a burner connection. an exhaust duct for products of combustion and a means of recirculating vapour back to the burner combustion chamber. The treated material is contained in the inner vessel which is equipped with a mixer mounted on a horizontal axis coaxial with that of the cylindrical floor of the vessel. The plant is equipped with temp. probes and controls to enable the proper control of temp. to be maintained.

The treatment plant is able to convert organic waste to a useful sterile product such as fertiliser or animal feed whilst obtaining some of the energy for the process from the waste itself. 14.2.79 as 001177 (9pp1370)

Carbon-di:oxide injector for silage fodder in trenches - mounted on tractor suspension unit with carriage for lateral motion and vertical insertion frame

UKR AGRIC MECH ELEC 19.07.76-SU-385612

P11 P14 (30.11.78) A01b-59/04 A01k-05

Device for introducing carbon dioxide into tightly packed feed silage, comprising tubular injectors, connected to a parallelogram mechanism on the suspension system of a tractor.

Operation is improved by fitting a carriage into guides which are mounted on the parallelogram mechanism, with the injectors firmly fastened to the carriage.

At the required location in the silage trench, the tractor is stopped and the injectors are lowered into the working position. At the moment the injectors are pushed into the mass they are only in the vertical position. Any horizontal movement is done using the turn-over frame operating on the rollers on the carriage. This ensures the injectors are inserted vertically. After injecting the CO_2 at the : desired location, the injectors are lifted out and the tractor is moved to another position so that the operation can be repeated.

Animal feed contg. addn. of Bacillus subtilis biomass - hydrolysing complex carbohydrate(s) and promoting formation of amino acids, vitamin(s) for increased nutrient value

UKR AGRI MICROBIOL 17.12.76-SU-430098

C03 (D16) (27.12.78) A23k-01

The nutrient value of feed for animals is increased by adding to the feed a liquid or lyophilically dried culture of Bacillus subtilis strain 44 in an amt. of 200-400 x 10^9 cells per one feed portion.

The Bacillus subtilis activates the assimilation of the feed by hydrolysing complex carbohydrates to readily digestible cpds. The synthesis of amino acids, vitamins and antibiotics is promoted.

Bacillus subtilis strain 44 was isolated from cattle rumen. It is highly active, in a test, it increased to amino acid content in a potato mash from 6.69% to 12.69%. The Bacillus subtilitis strain 44 hydrolyses starch to glucose and maltose. Its amylolytic activity in a potato-mineral medium is 100 units/100 ml; saccharifying ability is 500-900 mg/g; the liquefaction amts. to 80-100%. The carbohydrate fermentation yields 85-97% of lactic acid, i.e. about the same as the lactic acid bacteria. Bacillus subtilis strain 44 is cultivated in a boiled 20% potato pulp with addition of (in g/l) $(NH_4)_2HOP_4$ 5.0, K_2HPO_4 2.0, $MgSO_4$ 0.1; the pH is adjusted to 7.0-7.2, the temp is 37°C.; the cultivation is carried out for 3 days.

(15.12.78) A23n-15/08

The appts. comprises a loader and distributor, a turntable with working chambers, and a manifold with nozzles supplying compressed air to the chambers. To improve prod. quality and increase throughput, each chamber consists of a compressed air pot with annular knives, and a base is mounted for vertical reciprocation to lift an onion into the chamber.

The chamber nozzles are pref. displaced relative to its dia. A star wheel transfers onions from a conveyor singly to successive lift bases on the turntable and each onion is then lifted until the base enters the lower end of a chamber. This motion opens the air supply valve such that air entering through the nozzles rotates the onion so that its skin is cut and removed. On further turntable rotation a cam lowers the base and the onion is discharged onto a second conveyor.

Double whisk electric domestic beater support - comprises rotary base and column head with drive gears and toothed hub engaging bowl teeth
MOULINEX SA 28.02.78-FR-005657
(05.09.79) B01f-09/16

A support for beater with two axially parallel rotary whisks comprises a base on which a circular section bowl can rotate and a column extending from the base and with a free end head to receive the beater. The head is pivotable between positions with whicks in and out of the bowl.

The head holds a driven gear engageable with one whisk and engaged by a driving gear having a toothed hub projecting from the head to engage teeth on the bowl exterior. The driven gear engages the whisk closest to the bowl wall. The head undersurface pref. has a boss to guide the bowl internal surface. 19.2.79 as 005820 (6pp1358)

UNIL ★ D14 65101B/36 ★GB 2014-899
Roller impeller extrusion press - in which slip between the roller and die is monitored to indicate blockage
UNILEVER LTD 18.01.79-GB-001867 (18.10.77-GB-043309)
(05.09.79) B29b-05/04

In an extruder in which material is fed into the nip between a press roll and a die having extrusion orifices, through which the material is forced, either the roll or die is positively driven causing the other of the roll or die to rotate, and slip between the roll and die is detected. When the slip, or the rate of change of slip, attains a predetermined value the feed of material to the nip is varied.

Used partic. in the extrusion of animal feed pellets. Presses can easily block, choke, or flood, necessitating plant shut down to remove material from the nip, or even removal of the die to clear the orifices. By monitoring slip, conditions leading to blockage of the die can easily be detected and remedied. 18.1.79 as 001867 (7pp50)

SULZ D14 18932X/11 =NL-161-287
Irradiation device for canned goods, etc. - having two-storey revolving valve for locking containers in or out of the chamber
SULZER BROS LTD 02.09.74-CH-011877
*K08 +Q35 (15.08.79) *DS2442-916 G21h-05*

In an installation for the irradiation of materials transported in containers, the containers are guided through the two levels around a radiation source. The guiding mechanism includes a rotary slide by which the containers are moved into and out of the radiation chamber. There is also a lifting mechanism for transferring the containers from one level to the other. The heavy rotary slide in other installations requiring a great driving and braking force, is eliminated. In the irradiation chamber each level has its own transporter. The lifting arrangement in the chamber bridges over the difference in height from the one level to the other.

The rotary slide has two chambers one above the other which corresponds to the two levels, the one chamber delivering and the other withdrawing. In spite of the compact design, the plant has a great transporting capacity and hence can work with a larger radiation capacity. 18.9.74 as 012361 (15pp1014)

Self-controlling plasmolyser for use in food industry - has inductive coils opposingly wound on common cores between electrode and supply
ODESS FOOD EQPT DES 29.12.76-SU-436548
(30.11.78) A23n-01

The previous plasmolyser contains an electric supply connected to one of two concentric electrodes. For more effective electric treatment of raw material and to reduce load current variation, inductive coils are opposingly wound on common cores in pairs of arms. The load current is controlled over the whole length of the working gap to reduce the variation. The proposed plasmolyser is useful in the foodstuffs industry for treating vegetal and animal material by electric current.

In the gap, current is passed through the ground material, at the voltage of the two electrodes. Since the coils are wound opposingly, their magnetic fluxes are mutually compensated and so the inductive reactances in the arms have practically no effect on the value of the load current. An increase in current in any part leads to a coil self-induction e.m.f. for self-regulation.

Liquid confection freezing mould - with top edge ring detachable for insertion between upstanding rods to partly enter mould and form handle
RB TOY DEV CO 14.03.77-US-777325 (29.10.75-US-626654)
A92 P53 (21.08.79) A23a-09 B22d-05

A mould comprises a flexible cylindrical container with spaced rods on the side extending beyond the top edge and with the extensions inclined towards each other. The rods are spaced by $<$ 120°C and a flexible resilient circular ring is detachably connected to the top edge outside the rods at no more than three points.

The ring can be detached then placed in waisted figure eight form between the rods to lie partly within the container so that it forms a handle for the frozen prod. when ejected from the mould. The mould is e.g. of polyethylene. 14.3.77 as 777325 (5pp1358)

D15: WATER TREATMENT

DEGM ★ D15 64705B/36 ★BE -874-542
Continuous treatment of spent ion exchange resins - by treating resin in a column and periodically removing top fraction and introducing new fraction at the bottom
DEGREMONT SA 02.03.78-FR-005941
J01 (03.09.79) B01j

The top fraction is removed by a strong current of water and then the remaining resin in the column is displaced upwards through an equiv. distance by a short surge of liq e.g. at least $10m^3/m^2/h$. for about 60s. The new fraction pref. 12-15% of total vol. of resin, is then driven in under pressure.

The top fraction passes from the regeneration column into a washing column and thence back to the fixation column where the ion exchange process occurs. The spent resin is drawn from the bottom of the fixation column. Where several treatment liqs. are required, a number of regeneration columns. in series of parallel as appropriate are used, the displacement of the top fraction taking place in the same manner.

Any types of ion exchange resins can be treated with the appts. and method described, examples mentioned including demineralisation of boiler feed water and treatment of rinsing water used in electroplating. Moving the resin through the appts. in batches using short surges of liq. avoids fluidising the resin, which would lead to a reduction in regeneration efficiency. 1.3.79 as 874542 (11pp)

*J01 +Q42 (30.08.79) *BE-811-612 C02c-01/22 E02b-05/08 +E03f-05/14*

A filter grid for water canals and effluent channels is equipped with a mechanised cleaning rake which slides in between the bars at the bottom of the grid and then moves upwards carrying with it the rubbish which is then deposited in a collector at the top of the travel. The rake is attached to bars pivoted about a horizontal shaft attached to a carriage. The carriage is restrained to move vertically by vertical channels and carries its own drive motor. At the outer end of the drive shaft there is a pinion gear which engages in a vertical rack and is thus responsible for the descending and rising movement of the rake.

The hinged arms of the rake are equipped with guide cams which engage in channels at each side of the grid. At the top of the rise, there is a fork which causes the guide followers to move into an outer channel on the descent so that the rake is retracted from the grid. At the bottom of the guide channels the followers and consequently the rake are forced into an inner rising channel.

This arragement ensures a reliable and accurate movement of the rake without the necessity of the drive being immersed in the water and with min. of wear. 14.11.73 as 356801 (4pp1370)

Measuring the BOD of sewage - by analysing gas flow through
electrolytic oxygen generator recycled into sludge
VOITH J M GMBH 23.02.78-DT-807733
R16 (30.08.79) C12k-01 G01n-33/18

The activity of a mass of activated sludge into which a
stream of sewage flows is measured, in a process in which
the oxygen consumed is supplied pref. electrolytically;
the amount delivered being measured and recorded. In a
closed system, when the concn. of oxygen falls below a
certain level, the delivery of oxygen is commenced, and
the oxygen delivered is fed into a stream of air passing
through the activated sludge. The oxygen concn. of the
activated sludge is determined by means of the oxygen
concn. in the stream of air passing through; the amt. of
oxygen delivered being the same for each unit of time.

Process provides rapid, accurate and continuously
carried out measurement of the oxygen requirement, and
can be used for the control of a sewage purification plant.
The measuring process has the advantage that the intrin-
sic activity of the sludge is excluded. 23.2.78 as 807733

Water purifying appts. - including an ultraviolet source cooled by a fast moving airstream
THETFORD CORP 21.02.78-US-879204
P34 (D22) (05.09.79) A61l-03 C02b-01/38 C02b-03/02
D/S: E(BE, DT, FR, GB, NL, SW).

In a water purifier, a stream of water to be purified is passed adjacent a U.V. lamp and fed to a storage tank. A fast moving stream of air passes over the lamp to cool it and a slow moving stream of air moves adjacent the lamp to form ozone. The air containing the ozone is bubbled through the tank to further purify the water initially purified by the U.V. The streams of air may be fed separately, or may be formed by splitting a single stream of air.

By using fast flowing air to cool the lamp, which may be a conventional 2537A producing lamp, the lamp can be kept at the optimum working temp. to maximise ozone prodn.

Desalination of sea-water etc. by low temp. distillation - using
indirect heat exchanger supplied with hot fluid e.g. power statio
effluent
COMMISS ENERGIE ATOMIQUE 25.11.77-FR-035535
J01 (27.07.79) B01d-01/26 B01d-03 C02b-01/06
The process is effectect in a series of evapn. Chambers, C1 to Cn, in which evapn takes place at progressively decreasing temp. and pressure. In each chamber the vapou is condensed by an indirect exchange of heat with a primar fluid which progresses from chamber Cn to chamber C1, entering chamber Cn at a temp. T_f.

In each chamber, evapn. of the soln. is now obtained b indirect exchange of heat with a secondary fluid which circulated from the first chamber, C1, to the last chamber C i.e. flowing in reverse direction to the primary fluid through the chambers. The temp. Tc, at which the secondary fluid enters the first chamber C1, is higher than the temp Tf of the primary fluid. The soln. is pref. applied to the heating surface of the evaporative heat exchanger as a fil of liq., e.g. by spray. The evaporative heat exchanger is can, alternatively, be totally immersed in the soln. A fraction of the soln, drained from the chamber as surplus to evapn. capacity is pref. recycled together with fresh soln.

The main input of heat is no longer via the soln. to be evaporated but by way of a secondary fluid. It becomes possible to achieve high thermal efficiency from a compac installation; this is partic true when the two thermal fluids at different temps are freely available, e.g. cold seawate and hot seawater from the condensers of an electric power station. 25.11.77 as 035535(14pp448).

Flocculation plant for purificn. of waste water - comprises tanks connected in series each of which contains a gutter for receiving incoming waste
LECOEUR R A J 23.11.77-FR-035237
(27.07.79) B01d-21/ C02b-01/20*
The plant comprises $\geqslant$1 tank, pref. several tanks in series. Inside the top of each tank is a gutter, pref. annular, which receives incoming waste water for treatment, a well as a chemical reagent in liq. form. The base of the gutter is made up of inclined, perfurated plates which impart a swirling motion to liq. draining through the base.

Compressed air is pref. piped into each tank via a dive-gent nozzle directed towards the tank wall. When tanks are used in series, the upstream tank pref. has a low level outlet delivering by gravity to the top gutter of the downstream tank. The downstream tank gutter is at a lower level than the gutter of the upstream tank.

Used in flocculation of waste water as part of a physico-chemical purificn. treatment. Mechanical agitators and pumps are eliminated, so the new plant is cheaper and less likely to damage the developed flakes. Excellent con-ting for rapid flocculation is obtd. 23.11.77 as 035237 pp448).

Gravity filtration of water for drinking or mfr. of minerals - liminates iron, manganese and calcium as well as argillaceous ttachments
FOESSEL F 28.11.77-FR-035994
(27.07.79) C02b-01/26

The filter bed includes sand of a variety of particle sizes, filled in with clay in varying proportions. Passage through this bed eliminates from the water most of the iron and its rgillaceous attachments as well as manganese. The fil- ered water is pref. further purified by passing through a ed of activated carbon.

The installation pref. comprises, e.g. between the sand and activated carbon filters, a porous element contactor into which is injected air or other gas. The contactor de- livers via a nozzle water freed of iron and manganese, or via a further treatment which also eliminates calcium.

Used for demineralisation of natural water, partic. for drinking or for the mfr. of mineral waters. The simple inexpensive system is easy to operate. 28.11.77 as 035994 (5pp448).

LECO/ ★ D15 65056B/36 ★FR 2409-966
Decanting separator for flocculated waste water to be clarified - uses settled sludge to filter rising effluent
LECAEUR R A J 23.11.77-FR-035238
(27.07.79) B01d-21 C02c-01/26

The separator comprised a tank which has a base outlet for settled sludge and a high level overflow for clarified water. The tank now contains an open-topped vessel, with its top edge well below the tank overflow. An annular space between the inside of the tank and the outside of the vessel drains directly to the sludge outlet.

The flocculated waste water is piped directly into the bottom region of the inner vessel. Sludge settles in this bottom region, builds up further and eventually overspills into the annular space. Clarified water rises to flow from the tank overflow. Incoming waste water is pref. brought to the separator by gravity flow. The inner vessel pref. contains baffles to enhance sedimentation. The capacity of the inner vessel is pref. not less than half the vol. of waste water per hour for treatment.

Clarification of effluent is sludge settled in the inner vessel. Consequently, a separator of reduced bulk can be installed for a given duty. 23.11.77 as 035238(8pp448).

F09 J01 (24.07.79) B01d-15 C02c-05/02

An adsorbent for waste water contg. organic substances, is prepd. by calcining Al cpd. contg. SO_4 radical obtd. by the reaction of aq. $Al_2(SO_4)_3$ with aq. Na- or K aluminate, at ~500-700°C., or that prepd. by regulating pH to 5-6 during the reaction of aq. $Al_2(SO_4)_3$ with aq. Na- or K aluminate.

The adsorbent is very effective for the sepn. of organic substances, particularly coloured organic substances, used in the waste water of pulp chemicals mfr. There is no fear of secondary pollution because generation of the sludge is inhibited. 5.1.78 as 000420 (4pp126)

SEIW- ★ D15 65315B/36 ★J5 4093-851

Flocculant for waste water sludges - contains araban, galactan and rhamnosan, and is used for waste from dye, metal, food or chemical prodn., pulp mills, etc.

SEIWA KASEI KK 31.12.77-JA-158156

(25.07.79) B01d-21/ C02c-05/02*

The flocculant for sludge discharged from dye mfr., metal processing, food mfr., chemical mfr., pulp mills, etc., contains araban, galactan and rhamnosan as components.

The addn. of this flocculant to waste water, after pH regulation and sludge coagulation, in an amt. of 1-20 ppm. brings about the flocculation and pptn. of (in)organics, dyes etc. present in waste water in a very short time. Impurities present in the waste water coalesce into one body, and the coalesced substance is undivisible and also strongly absorbs BOD, COD, suspended solids and dyes. The treated water is very clear, and can thus be discharged to the environment. 31.12.77 as 158156 (3pp117)

SANK- ★ D15 65316B/36 ★J5 4093-852

Appts. for purifying human waste - removes coarse foreign components before adding slaked lime, frothing and sepg. by froth flotation

SANKYO YUKI KK (ASAH-) 30.12.77-JA-158159

(25.07.79) C02c-05

Human wastes deprived of coarse foreign matters in advance are mixed with slaked lime in a proportion of more than 3 times the stoichiometric amt. necessary for sepg. the dissolved components in human wastes in the form of calcium salts ppte., the mixture is emulsified with froth while blowing in air with stirring, and then the frothy mixture is separated into froth portion and liquid portion by flotation method, where the froth portion is defoamed and dried for removal of solid content and on the other hand, the liquid portion is separated from unreacted slaked lime by pptn. for recycling to the reaction system in a human wastes treatment appts. comprising a stirrer capable of introducing air, a receiving container with a conical bottom, a flotation vessel with opening leading to the receiving container at the lower part and an overflow opening at the upper part, and a conduit pipe connecting the tower type flotation vessel's bottom and the stirrer.

The method can treat human wastes continuously in a very short time with high purifying capacity, and also can discharge highly purified treated water to the outside. The method may use an iron salt and a foaming agent, in addition to slaked lime. 30.12.77 as 158159 (4pp117)

Aerobic treatment of waste water by activated sludge - has intermediate flocculation and filtration zone between aeration and settlement

ADWATRE INC 18.02.78-CH-001790

(21.08.79) C02c-01/06

Waste water is biologically purified in an aerobic basin with an aeration zone and a settlement zone, the two zones being sepd. by an immersed vertical wall which permits the passage of water and suspended matter across its upper edge from the aeration zone to the neighbouring zone and of sludge beneath the lower edge back into bottom of the aeration zone.

The treatment basin is equipped with an intermediate zone between the aeration zone and the settlement zone which serves as a flocculation and filtration bed. The intermediate zone is formed by the immersed vertical partition the inclined floor of the basin and an assitional inclined wall with a gap along its outer, lower edge through which the pptd. solids can fall back into the intermediate zone. The geometry of the intermediate zone is such that the communication gap between settlement zone and the intermediate zone is at approximately half the height of the latter zone and coincides with the level at which the water flow is at a minimum and is consequently laminar.

The use of the intermediate zone enables a satisfactory circulation of activated sludge to be attained without hydraulic disturbance of the settlement zone so that the clarification is maximised. The clarification is further assisted by the laminar flow zone which also serves as a filtration zone due to the presence of the coagulating particles. 16. 2. 79 as 001261 (16pp1370)

Ship's petroleum-contg. water purifier - has vertical column filled with spiral pipe with perforated upper surface through which gas or emulsifier emerges

KARPINSKII YU I. 16.07.75-SU-156344

H03 Q24 (30.11.78) B01d-17/02 B63b-35/44

Device for purifying petroleum-contg. water, as used in shipboard installations, comprising a body, spiral for twisting the flow, and pipes to admit the petroleum-contg. water, and taking away the water and petroleum separately.

The cleaning quality is increased by installing a pipe along the axis of the body; this pipe has holes adjacent to the turns in the spiral. The lower end of the pipe is closed off, and the spiral turns are made hollow and have perforations in their upper surfaces. Karpinskii Yu.I., Bul. 44/30.11.78 16.7.75 as 156344 (2pp29)

KZEN= ★ D15 65832B/36 ★SU -634-761
Device for magnetic treatment of water - has electromagnetic coil around which water carrying pipes are placed with rings of ferromagnetic material, used to reduce boiler deposits
KAZAN ENG CON INST 24.12.75-SU-303132
J04 (30.11.78) B01d-35/06 C02b-09

The device comprises an electromagnetic coil, outside which pipes made od diamagnetic material, with connecting pipes to admit and withdraw the water, are installed.

Compactness and simplicity of the equipment are guaranteed by fitting the electromagnetic coil with packed rings made from ferromagnetic material adjacent to the walls of the pipelines, which are themselves made circular.

Recycling aerator - esp. for carbohydrate fermentation reactor, with gravitational and centrifugal pump degasifiers followed by air injector and blender
VEB CHEMIEANLAGENBA 28.12.72-DL-168022
*(30.11.78) *BE-809-112 B01f-01*

A reaction mixt. esp. a carbohydrate ferment is degassed by recycling through a circuit comprising a gravitational foam separator within the reactor from which partly degassed liq. is drawn into a centrifugal pump (with an axial outlet for centrifugally separated gas) and is pumped up to a tubular overflow (into the top of the reactor) where air is injected via multiple jets and drives blend down tube and below surface of reaction mixt. The foam separator has a vertical gas-lift tube from which foam vents through a control valve and is delfected onto surface of reaction mixt. wnere it tends to break and release gas to an outlet duct.

The reactor may have e.g. 2 superimposed compartment connected via another air injection tubular overflow the liq. input to which is drawn largely from below surface to exclude foam and equalize contact conditions. Space-time efficiency is improved, e.g. 5 times over known aerating circulators, while economising 50% of specific energy requirement.

KUIB ★ D15 65950B/36 ★SU -635-04
Deaerator for boiler feed water, etc. - has inlet pipe terminating confuser and short intermediate cylindrical and diffuser sectio used in power station etc.
KUIBYSHEV POLY 17.02.76-SU-325963
(30.11.78) C02b-01/10

De-aerator for superheated water, fed to the boilers in power stations, and used as make-up water in heating systems, comprising a body with a pipe to admit the aerated water, and other pipes to take away the water and th steam. At the place where the inlet pipe meets the body there is a nozzle, made up of confuser and diffuser sections in series.

Effectiveness is increased by inserting a cylindrical piece between the confuser and diffuser.

The water from which the air is to be removed, at a temp. above the satn. temp. corresp. to the press. inside the body of the appts., enters through the inlet pipe to the confuser section where its velocity increases. The drop in static pressure in the water flow leads to the formation of centres of steam formation and the liberation of steam bubbles. The static pressure falls further in the small cylindrical section to a value which is less than the satn. pressure at the water temp. This leads to boiling over the entire vol. with the formation of a stable vapour phase.

esalination process using atomised mercury as refrigerant -
ncludes forming solid block of ice which is forced upwardly by
ncoming water
FAB MAQUINAS SA 23.11.77-US-854473
(21.08.79) B01d-09/04

The process includes feeding the impure water to an elongate vertical closed tank to a level above the inlet level. A body of mercury is continuously cooled externally of the tank and this is injected as finely atomised particles into the upper portion of the established water column. The mercury is withdrawn from the bottom of the tank and recirculated.

Ice crystals are formed and these are permitted to accumulate and form a solid block of ice on the upper portion of the tank above the mercury injection level. The block of ice is moved upwardly in the tank by the hydraulic pressure of the incoming impure water. The upper region of the block of ice is melted by indirect heat exchange with the impure water prior to entry into the column. The melted water is withdrawn from the top of the column and conc. salt water and pptd. salts are collected from the lower portion of the tank.

The process is used to obtain pure water from a saline soln. Because the mercury is finely atomised and is moved at a high flow rate, it can have a very small temp. differential with the saline soln. Additionally, no ice crystals form around the mercury itself. 23.11.77 as 854473 (4pp295)

A closed circuit constructed from an endless tube in the form of an extended toroid is used for the cultivation of microorganisms. The closed circuit is equipped with connections for introducing nutrient salts, raw material for the culture, liq. for maintaining a required pH value, innoculating microorganisms and a gas. There is also a discharge connection for the culture. The circuit for the culture. The circuit includes ≥1 propellor for mixing and circulating the fluid preceeded by a foam damper and, before that, a heat exchanger.

The foam damper consists of a cylindrical vertical pot into which the foam bubbles generated in the culture rise and a spray manifold fed by a pump which is fed by a circulating pump drawing prod. from the main loop upstream of the foam damper. The foam collapses allowing the gases to be vented whilst the liq. is recirculated back into the system immediately before the propellor. The heat exchanger has a larger cross-sectional area than that of the circulating pipe so that a laminar zone is created in which the gas bubbles are able to grow thereby promoting their effective sepn.

The system meets the two conflicting demands of a good dispersion of the feed gas to encourage the growth of the culture whilst removing the waste gas generated which tends to slow the growth rate. 31. 10. 72 as 253422 (6pp1370)

Cholesterol determination procedure - in which bound cholesterol is released using microbial cholinesterase
BOEHRINGER MANNHEIM GMBH 01.03.74-OE-001679
*B04 R16 (30.08.79) *DT2506-712 G01n-31/14 G01n-33/16*

Process for the determn. of total and bonded cholesterol comprises enzymatic cleavage of bonded cholesterol using cholesterolesterase (obtd. from a wide range of micoorganisms, esp. Rhizopus spec. WS 90027, Aspergillus spec. WS 90030, and certain Actinomyces, Streptomyces, Candida and other species, but excluding Candida rugosa), followed by determ. of total chloesterol by the usual methods.

Enzyme reactions can be used for the determn of free cholesterol. The process is a valuable diagnostic aid. 18. 2. 75 as 506712 Div. in 2559875 (4pp047)

SCHI/ D16 33491A/19 =DS 2700-698
High yield microbiological prodn. of unicellular protein foodstuff - by aerobic yeast fermentation of ethanol in circulating medium
SCHICK J H 10.01.77-DT-700698
*(D13) (30.08.79) *BE-862-675 C12d-13/06*

Single-cell protein(SCP)based on ethanol (I) is produced microbiologically by cultivating, in aq. culture medium (II) having a pH value of 2. 5-4 contg. nutrient salts, acid phosphate and cpd. contg. N in the presence of (I) and O_2, yeasts ultilising (I) at 20-40°C under aerobic conditions in a fermenter (III), the biomaterial (IV) so cultivated is sepd. and dried and isolated as protein prod.

Constantly agitated (II) is circulated, and for each cycle of (II) the nutrient medium (V) is introduced , in tangential direction, at a point of the cycle path. (V) is gassed with ultrafine O_2 bubbles of size 1-7mu, (IV) produced in (III) is passed through (III) without forming a gas cushion, de-gassed outside (III) and the residence time of the gas-liq- solid mixt. in (III) is regulated to 0. 2-1. 0 h^{-1}.

The process, relative to known processes, gives higher substrate- and O_2 yields and SCP prods. of higher purity. 10. 1. 77 as 700698 (5pp481)

Mineralocorticoid 3 beta, 16 beta-di:hydroxy-5 androstenone prodn. - by fermentation of the di:acetate with Flavobacterium esteroaromaticum, Streptomyces halstedii or S. vinaceus
SCHERING AG 09.02.77-DT-705917
*B01 (30.08.79) *DT2705-917 C07j-01*

Prepn. of 3β, 16β-dihydroxyandrost-5-ene-17-one comprises propagation of Flavobacterium esteroaromaticum, Streptomyces halstedii or Strep. vinaceus in a suitable culture medium in the presence of the corresp. 3β, 16β-diacetoxy cpd. at pH 6. 0-7. 0, the prod. is then recovered from the culture medium. The prod. has mineral corticoidal activity. 9. 2. 77 as 705917 (3pp047)

CHEM- D16 06659A/04 =DS 2722-921
Animal and human tissue cells cultivator - keeping cells in circulating suspension by nutrient gas bubbles
CHEMAP AG 15.07.76-OE-005213
*(30.08.79) *DT2722-921 C12k-09*

Human or animal tissue cells are cultivated in a feed culture within a closed container into which an oxygen rich gas is introduced. The gas is introduced in such a manner that a circulating is induced between two zones of narrowly differing hydrostatic pressures, the circulation being just sufficient to keep the tissue culture in suspension without causing damage to the cells. The process is pref. carried out in a cylindrical vertical container inside to which, extending over a part of the height of the container there is an inner cylindrical guide wall. In the floor of the container there is a partition through which the oxygen rich gas is introduced via small holes which lie within the circumference of the guide wall.

The system enables large scale cultivation to be carried out without mechanical agitation and the consequent risk of cell damage. 20. 5. 77 as 722921 (7pp1370)

KLEI/ ★ D16 64776B/36 ★DT 2805-607
Bio-catalyst prodn. in polymer matrix - of crosslinked poly:methacrylamide by two/stage polymerisation, with addn. of microorganisms just before gelation
KLEIN J 10.02.78-DT-805607
A96 B04 (A14) (30.08.79) C12d-13/10 C12k-01

Prodn. of biocatalyst and polymer matrix from microorganisms is claimed. Mixts. are prepd. from (A) (a) moist or dry cell matter of viable or dead microorganisms and opt. (b) physiological aq. saline soln. to give the required flow; (B) a soln. or dispersion of (c) 60-90 (wt.)% methacrylamide, (d) 10-30% water-soluble divinyl cpd. e.g. N, N'-methylenebis-acrylamide, as cross-linker and (e) 0-30% comonomers to control the particular network properties, all w.r.t. (c+d+e), (f) opt. 0.05-2.0% co-initiator, e.g. tetramethylethylenediamine or dimethylaminoethyl methacrylate, (g) 0-1% mol. wt. regulator, e.g. thioethanol, (h) 0-25% water-insol. filler to increase the compressive strength(all w.r.t. b-k) in (i) water adjusted to pH 7-9 with acid, alkali or buffer; (C) (j) 0.05-2.0% water-soluble free radical initiator, e.g. peroxydisulphate (w.r.t. b-k) and (k) water in the ratio j:k = 5-30:100 and (D) (l) water-immiscible suspension medium and (m) suspension stabiliser in the ratio l:m = 10 000:1-1000 and opt. a surfactant, e.g. cetyl alcohol. The sum of (c-e) is 10-50 wt. % of the sum of (b-k), (a) is max. 40% w.r.t the sum of A+B+C and the vol. ratio of D to A+B+C is min. 2:1, to give a high mechanical stability.

After opt. degassing with O_2-free inert gas, polymerisation is carried out in B and C at a (j) concn. of 0.05-2.0 wt. % and at -5°C to +80°C. Just before the gel point is reached, A is incorporated, followed by D to give a suspension of aq. in non-aq. liq. and polymerisation is completed in suspension in the same temp. range. The biocatalyst beads formed are sped., washed with saline soln. and opt. classified; the liq. phase is opt. recycled and the viable microorganisms are opt. re-incubated to increase the biocatalytic activity.

Prod. is useful as a "fixed enzyme system" for industrial processes, analytical, diagnostic and medical applications. The fixed cells have satisfactory to high activity and the mechacrylamide block polymer has little compressibility. Gels with polymer contents of 20 wt.% have satisfactory mechanical properties, whereas higher polymer concns. (~ 40%) are needed with polyacrylamide gels, the toxicity of the monomer causing high loss of enzyme activity. 10.2.78 as 805607 (33pp016)

FRNG ★ D16 64839B/36 ★DT 2808-022

Ultrafiltration circuit with recirculation - having two ultrafilter modules mounted in vertical leg with liq. head of 0.5 to 1.5 times pressure drop in module

FRINGS H FA 24.02.78-DT-808022

J01 (30.08.79) B01d-13 B01d-31

Continuous ultra-filtration of a liq. involves the use of a circulation vessel in which the liq. level is kept automatically controlled. From this vessel liq. is recirculated round ⩾1 circuits, each of which contains ⩾2 filter modules. Filtrate from these collects in a vessel at the base of the main vessel.

Recirculation circuits have low pressure drop. In them are located ⩾2 modules mounted vertically in series with flow from top to bottom. The vertical distance between them is equivalent to 0.5 to 1.5 times the pressure drop across them.

Used for clarifying liquids esp. those contg. biological impurities such as micro-organisms e.g. in vinegar, fruit juices and wine. Gives a system which operates continuously, is environmentally favourable and has a high filter-loading with max. supervision. 24.2.78 as 808022 (12pp1053)

AGEF- ★ D16 64860B/36 ★DT 2808-242

Enriching grape juice with carbon di:oxide - by injection immediately after breaking the grapes, useful in wine making

AGEFKO KOHLENSAURE 25.02.78-DT-808242

(30.08.79) C12g-01/02

Enriching pressed grapes and fresh grape juice with CO_2 comprises adding CO_2 gas directly after destroying the skins of the fruit, so that some of the CO_2 dissolves. Pref. the CO_2 is introduced under pressued through a nozzle so that intensive mixing is achieved. Opt. the subsequent fermentation, draining, clarification and collecting vessels are also blanketed with CO_2, and pref. treatment is carried out at the temp. required for subsequent fermentation.

Used in wine making. Improved protection against oxidn., reduced amts. of SO_2 needed (by up to 40%), superior colour, aroma and taste, and improved capacity are obtd. since foaming is reduced. 25.2.78 as 808242 (14pp1251)

FINN- ★ D16 64904B/36 ★DT 2905-558

Automatic measurement of agglutination test samples - using reaction cells in which non-agglutinated particles settle away from the measuring beam

FINNPIPETTE OSMO SU 28.02.78-SF-000670

B04 J04 R16 (30.08.79) C12k-01/04 G01n-21/02 G01n-33/16

Automatic measurement of results of an agglutination test comprises first incubating the sample (to deactivate it before measurement) in a reaction vessel (e.g. a cell). The vessel is slanted during incubation so that where no agglutination occurs the non-agglomerated particles collect in the lowest part or corner and are removed from the region of the measuring radiation. When agglutination does occur, particles remain within the region of the measuring beam.

The cells may alternatively have bases suitably shaped to achieve the same sepn. between agglomerated and non-agglomerated particles. The method is useful with spectrophotometers, adsorption photometers, fluorometers and nephelometers.

Used in detection of bacteria, fungi, viruses, antigens, antibodies and abnormal proteins etc., and for pregnancy testing. It is applicable to a wide range of assay procedures. 14.2.79 as 905558 (18pp1251)

TOXN ★ D16 64907B/36 ★DT 2905-6

Immobilised protein for quantitative analysis of enzymatic reactio - comprises a biologically active protein chemically bound to wate insol. acrylonitrile polymer contg. free amino gps.

TOYO BREWING KK 17.02.78-JA-018001

A96 B04 J04 R16 (A14) (30.08.79) C07g-07 G01n-31/14 G01 33/16

Pref. the acrylonitrile polymer is porous esp. with mic -pores of av. size 40-9000 Å, and is in the form of fibre particles, membrane or hollow fibres, the polymer contains amino gps. in such a quantity that it is scarcely sol uble in water, pref. 20-1000 μ mol. amino gps. per gran polymer.

Pref. the carrier contains ⩾90% arylonitrile; esp. the carrier is a copolymer of acrylonitrile, divinylbenze and vinylethylbenzene. The giologically active protein is pref. an enzyme, attached to the carrier by physical adsorption and/or covalent bonding.

The biologically active protein is chemically attached to the carrier by covalent bonds and is therefore sepd. only with difficulty from the carrier. The protein is neither deactivated nor destroyed and keeps, for long periods, its activity towards a particular substrate. The immobilised protein can be used in quantitative analysis e.g. of the products of an enzymatic reaction of the biologically active protein is an enzyme, e.g. cholinoxidase or uricase. 14.2.79 as 905671 (64pp1401)

YAMS ★ D16 64923B/36 ★DT 2906-73

L-Lysine-alpha-oxidase prodn. from Trichoderma viride - for L-lysin enzymatic determination e.g. in clinical diagnosis or food analysis

YAMASA SHOYU KK 22.09.78-JA-115867 (27.02.78-JA-020993)

B04 (D13) (30.08.79) A61k-37/50 C07g-07/02

L-Lysine-α-oxidase (I) is a new enzyme which (a) produces α-keto-ε - aminocaproic acid, ammonia and H_2O_2 from L-lysine by oxidative deamination in the presence of water and O_2; (b) has a very low Michaelis constant; and (c) has a very high substrate specificity for L-lysine.

(I) can be used for the enzymatic determination of L-lysine, esp. in the determination of the L-lysine content of foods and beverages and in the diagnosis of lysine-uraemia or hyperlysinaemia, such determinations can be based on measurement of the amt. of α-keto-ε -aminocaproic acid or H_2O_2 formed during the enzymatic reactio or the amt. of O_2 consumed during the enzymatic reaction 21.2.79 as 906737 (+16.6.78-JA-073441) (37pp280)

FARB D16 63329B/35 =EP —3-786

Phenyl-glycine derivs. enzymatic optical resolution - by stereoselective cleavage of N-acylamide or ester derivs. with carrier-bound enzymes

BAYER AG 21.02.78-DT-807286

*A97 B05 (A14) (05.09.79) *DT2807-286 C07c-103/50 +C07b-19/02 C07c-101/08*

D/S: E(BE, CH, DT, FR, GB, IT, NL, SW).

In the stereoselective cleavage of DL-phenylglycine derivs. and DL-4-hydroxyphenylglycine derivs., the ester or amide gp. of a corresp. N-acyl ester or amide is hydrolysed by means of carrier-bound enzymes; the N-acyl-D-phenylglycine ester or amide (or corresp. 4-hydroxy cpd.) is sepd. from the N-acyl-L-phenylglycine or N-acyl-L-4-hydroxyphenylglycine; and the ester or amide gp. of the D-enantiomer and/or the N-acyl gps. is/are opt subsequently acidically hydrolysed.

D-Phenylglycine and D-4-hydroxyphenylglycine are intermediates for semisynthetic penicillin antibiotics. L-Phenylglycine is also an intermediate for the sweetening agent L-asparaginyl-L-phenylglycine methyl ester.

Use of N-acyl derivs. of the starting DL cpds. allows much higher concns. of cpds. to be used than is the case with N-unsubstd. cpds.

Immunochemical assay of LDH-1 isoenzyme in serum - after removal of other isoenzyme cpds. by complexing with antiserum, for diagnosing myocardial infarct
HOFFMANN-LA ROCHE AG 27.02.78-US-882013
A96 B04 J04 R16 (05.09.79) G01n-31/14 G01n-33/16

Assay of LDH_1 activity in serum comprises first treating the sample with an antibody (A) selective for the M subunit of LDH isoenzymes, so as to form complexes with LDH_n (n = 2-5). The mixt. is then treated with a second antibody (B), raised in a different animal than (A) and insolubilised on a solid support.

The reaction prod. of (B) with the complexes is then re moved and LDH_1 analysed conventionally in the supernatant Pref. (A) is goat anti-LDH_5 and (B) is donkey anti-goat γ-globulin immobilised on activated 'Kynar' (RTM for a vinylidene fluoride resin).

LDH_1 is a known marker for myocardial infarct. Metho is much more rapid than electrophoresis, and highly accurate and reproducible with a clean sepn. of LDH_1 from other isoenzymes which is not possible by ion-exchange chromatography. 26.2.79 as 006732 (5pp1251)

Metallic soap prodn. - by splitting fatty oil using lipase in presence of multivalent metal hydroxide
MEITO SANGYO CO KK 12.01.78-JA-001561
E12 (28.07.79) C07c-51/09

Metallic soap is prepd. by splitting fatty oil using lipase in the presence of hydroxide of multivalent metal. Fatty oil is olive oil, bean oil, linseed oil, rapeseed oil, ricinus oil, tallow, lard, fish oil, etc. Any lipase which has strong splitting power in alkali can be used. Lipase is used in amt. of 5-1000 units per 1 g. of fatty oil. Fatty oil is split in the presence of 5-200 wt.% of water and 100-200% (by equiv. ratio) of a hydroxide of multivalent metal (e.g., $Ca(OH)_2$, $Mg(OH)_2$, $Ba(OH)_2$, $Al(OH)_3$, $Cd(OH)_2$, $Mn(OH)_2$, $Co(OH)_2$, $Pb(OH)_2$, $Zn(OH)_2$, $Zn(OH)_2$, $Cr(OH)_2$, etc. in the presence of lipase. Metallic soap is sepd. by the removal of glycerine using solvent (such as water, acetone, ethanol).

Fatty oil is split readily into fatty acid and glycerine in a high rate, and metallic soap of high quality is obtd. easily. 12.1.78 as 001561 (3pp170)

Airborne microorganisms trap - has two symmetrical sprayers with the narrow ends of their funnels facing each other
POULTRY VETER SCIE 08.06.77-SU-496041
(05.12.78) C12k-01

Increased adsorption of microorganisms is ensured by increase in the dispersion of the aerosol using an additional sprayer inside the vessel. The two sprayers are set symmetrically, and the narrow part of their funnels face each other.

Air evacuation through connector produces partial vacuum in the vessel, and the examined air flows through inlet ports and funnels to spray the nutrient soln. The latter arises in the capillaries, the symmetrical sprayers ensuring intensive mixing of droplets. This increases the adsorption of the microorganisms.

Microbial synthesis from oxygenated hydrocarbon feedstock - giving polymeric gum prod. useful as water flood additive, drilling mud additive and plugging agent
PHILLIPS PETROLEUM CO 18.10.74-US-515873 (12.08.68-US-751926)
A97 H01 Q49 (H04) (29.06.76) E21b-43/16

Method of water flooding comprises diluting a polymeric gum (I) possessing water viscosifying properties, with water or brine to a suitable viscosity and injecting the resulting diluted gum into an oil bearing strata. Method of treating drilling mud comprises mixing (I) with drilling mud and thus adjusting the viscosity of the mud. Method of plugging an oil bearing strata comprises solubilising at a pH below 10 (I); injecting solubilised (I) into the formatiotion; and then injecting an alkaline material into the formation to raise the pH of the solubilised (I) thus increasing the viscosity of (I) in the formation.

(I) is produced by microbiosynthesis as cellular prodn. prods. from oxygenated hydrocarbon feedstock containing aldehydes and other oxygenated hydrocarbons. The feedstock is formed by adding at least one N contg. cpd. reactive with the aldehydes rendering them innocuous. Oxygenated hydrocarbon-utilising microorganisms effective to produce (I) under fermentation conditions are then cultured on the feedstock. The microorganism is selected from Pseudomonas, Methanomonas, Arthobacter, Corynebacterium, Bacillus, Mycobacterium, Actinomyces, Nocardia, Micrococcus, Rhodobacillus, Chromatium, Serratia, Rhizobium, Aerobacter, Escherichia and Streptococcus.

(I) can be used as water flood additives, as in the recovery of oil, or as a drilling mud additive and as a water loss control agent. (I) will increase the viscosity of a drilling mud and will hold suspended solids. (I) has no sensitivity to salts and is compatible with other mud additives. (I) can also be used as a selective plugging agent and viscosifier for oil formations. (I) is protected from microbial degradation by high pH. 18.10.74 as 515873 Div. ex. 3856774, 3642758 (cf. 01831W/01) (+29.7.71, 4.6.73-US-167177, 366563) (9pp954)

Improving filterability of bio-polymers used in oil recovery - by caustic enzyme treatment
CONTINENTAL OIL CO 13.03.78-US-886021
A97 H01 Q49 (21.08.79) C12d-13/04 E21b-43/22

In the recovery of hydrocarbons from subterranean formations by flooding with aq. mixt. of biopolymers treated with enzymes to solubilise cell debris prior to filtration, the improvement comprises improving the filterability of the polymer by treating it with 'Esperase' (RTM) enzyme at a pH of 12.5-13. Specifically, the enzyme is used in an amt. of 2½-10 wt.% and the treatment is affected at 75-120°F. The filtration is effected using diatomaceous earth filters.

The combination of the specific enzyme and the high pH acts synergistically to improve filterability and reduce filter plugging if filtration is necessary. 13.3.78 as 886021 (4pp920)

FORE- D16 12818Y/08 =US 4165-387
Brewing beer of better storage stability - using strain of barley with very low anthocyanogen and catechine content
FORENEDE BRYGGENER AS 15.10.75-DK-004640
*E13 (21.08.79) *BE-847-191 +C12c-01 C12c-11/04*

Beer of acceptable stability and taste is mfd. such that the wort extracted from barley or malted barley is fermented to produce beer. In the process, a strain of barley is used having a content of <20 mg of anthocyanogens per 100 g of dry matter caused by an inherent genetical blocking of the anthocyanogen synthesis in the barley.

Pref. the barley used is the mutant ANT-13 of the strain Foma, and has a anthocyanogens content of <10 mg per 100 g of dry matter.

The haze in beers attributable to anthocyanogens (3,4-flavanediols) and/or catechins is reduced without the addn. of precipitants or further additives. 12.10.76 as 731497 (3pp931)

Fructose sepn. from glucose - by diffuse-dialysis of isomerised suga soln. or hydrolysed sucrose soln. using cation exchange membrane
ASAHI DOW KK 13.01.78-JA-001946
A88 E13 (A91 D16) (28.07.79) C13k-11

Method comprises diffuse-dialysing isomerised sugar sol or sucrose hydrolysed soln. using cation exchange membrane. As cation exchange membrane, that having sulphonic acid gp., carboxylic acid gp., sulphamic acid gp. or their alkali metal salt gp. in its major chain or side chain is used. Partic. that having sulphonic acid gp. in the major chain obtd. by treating EVA copolymer with fuming H_2SO_4 is used and that having proton-form is superior to that having alkali metal salt-form in sepg. velocity and sepg. efficiency. The membrane having thickness 5-50 (10 20) μ is used.

Fructose is easily sepd. from glucose with high sepg. velocity and high sepg. efficiency by diffuse-dialysing thei mixed soln. using thin ion exchange membrane. 13.1.78 as 001946 (3pp5)

KAWA- D17 27553A/15 =J7 9022-962
Improvement of fruit sugar deliquescence - including pre-coating the particles with coating agent e.g. cane sugar or gelatin
KAWAZU SANGYO KK 09.08.76-JA-094701
*(10.08.79) *J53021-113 C07h-03/02*

Deliquescence of fruit sugar is improved by moulding the fruit sugar crystals having volatile substance content 5-30% relative humidity 30-60% to produce fruit sugar particles having water content 0.1-2.0%. The particles are then precoated with coating agent e.g. cane sugar or gelatin moulded into fruit sugar blocks, and the blocks are then sugar coated to tender the grape sugar nondeliquescent. The decrease of water content of fruit sugar can be controlled and continuous treatment can be conducted when moulding is conducted at relative humidity 30-60%.

At humidity < 30% decrease of water content of fruit sugar occurs. At humidity > 60% fruit sugar crystals become deliquescent, the extrusion-moulding operation is difficult. Pref. relative humidity is 40-50%. The fruit sugar moulded to particle form or granule form is dried to water content 0.1-2.0%. Pre-coating treatment is conducted using a coating agent e.g. cane sugar or gelatin-like substance. The pre-coated fruit sugar particles are tabletted to obtain the fruit sugar blocks and these are coated with can sugar.

Fruit blocks show improved deliquescence compared

to those obtd. by tabletting the fruit sugar particles without pre-coating, and also show improved shelf life.

Prodn. of sugar soln. from cellolignin - using two/stage hydrolysis with dilute aq. sulphuric acid at specified temp., to increase yield
PROTEIN BIOSYNTH RE 26.07.77-SU-511467
(30.11.78) C13k-01/02

Cellolignin, obtd. from cotton husks, etc. is hydrolysed with aq. sulphuric acid followed by the sepn. of lignin from hydrolysate and the sepn. of the sugar by washing with water to give sugar soln.

In order to increase the yield of sugar and to reduce the process time, the hydrolysis of cellolignin is conducted in two stages. In the first stage, the cellolignin is hydrolysed for 0.5-1.5 hrs. under percolation, and in the second stage it is hydrolysed in stationary condition for 0.25-1 hr. The resulting hydrolysate is then cooled to 130-140°C. The lignin is sepd. and washed with water at 30-100°C outside the zone of the hydrolysis, to prevent its decompsn.

The method increases the yield of sugar by 20-30%, reduces the mfg. cost and gives a high quality prod. Klimova Z.K., Belenkii S.I., Bul. 44/30.11.78 26.7.77 as 511467 (2pp938)

A solution of menthol in alcohol is applied to a continuous roll or absorbent paper backed by a layer of foil. The paper is then used to form cigarettes and the menthol permeates into the tobacco. The menthol solution is applied by means of an applicator head fed by a metering pump, the head being stationed above a continuously fed band of the wrapping paper. The paper is wound from one spool onto another. Intermmediate rollers coupled to a braking device and to a rotational speed counter accurately control the band tension and measure the speed at which the paper passes the applicator head. The meter pump is controlled so that the output of fluid is proportional to the paper throughput rate.

The mechanism enables the menthol to be accurately applied and evenly distributed so that the end product is evenly permeated with menthol. 3. 5. 77 as 719793 (9pp1370)

Folding machine for profiles esp. of leather - presses quickly through work-table slot to ejector between folding clamps
ULLRICH W 24.02.78-DT-808076
(30.08.79) C14b-11

Patterns cut out from leather are folded mechanically into one or more permanent creases, by pressing the profiled section along the selected folding lines. The machine has a flat worktable with a folding slot, limited by folding edges on both sides. Above the slot there is a holding down plate which can be lowered through the slot, and below, there is an ejector in line with the holding down tool, which can be lifted to the surface of the slot. In addn. there are beneath the slot, folding cheeks which can be moved parallel to the worktable across the vertical plane through the centre line of the slot, into contact with each other.

The motions of the holding down tool, the ejector and the folding cheeks are synchronised in such a way that a pattern can be clamped between holding down tool and ejector. The two, with the pattern of leather can then be drawn into the range of the folding cheeks, and removed from the pattern, before the cheeks come together to make the folding line desired.

Enables all kinds of cut out sections for purses, briefcases, etc. to be folded cheaply and quickly without it being necessary to provide expensive tools. 24.2.78 as 808076 (16pp1045)

Tobacco leaf drying frame - has concentric circles of parallel needles between flat base and cover for stacking, to give higher packing density
KISH POLY 18.03.77-SU-464442
P15 (15.12.78) A24b-01/02

The frame for drying tobacco leaves in a chamber has parallel needles on a holder and a cover. To increase packing density and improve drying conditions the holder and cover are flat rings and the needles are disposed on concentric circles.

Freshly picked and sorted leaves are placed in the frame, then frames are stacked to leave central drying air supply channels with perforated sides and closed to the stack top by a plug. The moist air exiting from the stack sides passes through a suction main to a heat-exchanger and back through a circulation fan. The arrangement provides a concentrated and directed air supply to the leaves to reduce drying time and doubles chamber packing density.

Stabilising carpronium chloride against hydrolysis - by adding malic acid buffer, for use in cosmetics, hair tonics, skin creams etc.
DAIICHI PHARM KK 22.02.77-JA-018347
E16 (28.07.79) A61k-07

Carpronium chloride is stabilised against hydrolysis by adding malic acid buffer. Carpronium chloride has local blood vessel vasodilator action and is used for lotion cosmetics, cream, stick, aerosol, hair tonic, shampoos, and skin creams.

In an example, 50% ethanol (420 l.) was placed in a dissolving tank, dl-malic acid (3.35 kg.), sodium hydroxide (1.20 kg.), carpronium chloride (25.0 kg.), propylene glycol (25.0 kg.), perfume (suitable amt.), dyestuff (suitable amt.) were dissolved and 50% ethanol was added to 500 l. The resultant nitruent hair lotion was preserved at room temp. for three years and residual ratio of carpronium chloride was >90%. 22.2.77 as 018347 (2pp69)

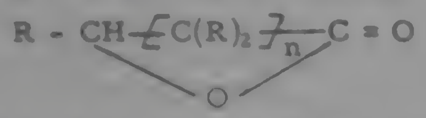
Q33 (30.08.79) B65d-55/10

Beverage bottles are sterilised using the method of dipping in an aq. soln. of sulphur dioxide by removing the residue of the soln. with the aid of compressed sterile air. The amt. of water used is reduced and pollution with acidic water of environment is prevented.

Pref. the blowing with compressed air which is preheated to approx. 35°C is effected with the bottles in their upturned position. In partic. it is pref. to use a filtered sulphurous acid soln. which is sprayed with the aid of a nozzle passed into the bottles, recirculating the soln. and filtering it, and, drying the sterilised bottles interior by removal of residual soln. using a pipe which is introduced into the bottles and which is provided with a blast nozzle. 22.2.78 as 807617 (9pp536)

UNIC ★ D22 64989B/36 ★EP ---3-845
Orthopaedic cast or splint, or bandage for applying cast - comprising thermoplastic copolymer of lactone and acrylate having controlled degree of crosslinking
UNION CARBIDE CORP 24.02.78-US-881138
A96 P32 P34 (A23) (05.09.79) A61f-13/04 A61l-15/07
D/S: E(BE, CH, DT, FR, GB, IT, NL, SW).

(A) An orthopaedic device, for fixing and immobilising a portion of the human or animal body, comprises a solid polymeric material shaped to the contours of the body. The polymeric material is the prod. of crosslinking a thermoplastic polymer produced by reacting an active-hydrogen-contg. initiator at 25-300°C with a molar excess of a monomer mixt. comprising (A) 90-99.5 (pref. 95-99.5) wt.% of a lactone of formula



$$R-CH-[C(R)_2]_n-C=O$$

(where n is 3-6; ⩾ n + 2 R gps. are H, and any remaining R gps. are 1-10C alkyl) and (B) 0.5-10 (pref. 0.5-5) wt.% of a polyfunctional acrylate monomer.

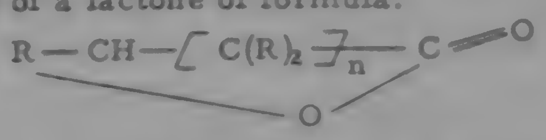
(B) A bandage, suitable for forming an orthopaedic cast, comprises a substrate in the form of a netting, the strands of the netting having on their surfaces a coating of the crosslinked polymer described above.

(C) Methods of producing the bandage and applying it, and a method of applying splints made of the crosslinked polymeric material, are also claimed.

The degree of crosslinking of the polymer can be controlled to provide optimum properties for applying it to the body portion being treated. The polymer does not become fluid on heating, but becomes soft and rubbery; also it can be heated dielectrically, obviating the use of a hot water bath. A rolled bandage of the material can be heated to softening pt. without danger that the layers will irreversibly fuse together on the roll. The cast or splint is rigid, porous and lightweight, and is sufficiently strong to be used in load-bearing applications such as lower leg casts.
23.2.79 as 100553 (46pp914).
(E) ISR: US3692023.

UNIC ★ D22 64990B/36 ★EP ---3-846
Thermoplastic crosslinkable copolymer - produced by reacting lactone and polyfunctional monomer in presence of active hydrogen initiator
UNION CARBIDE CORP 24.02.78-US-880955
A23 (A96) (05.09.79) C08g-63/08
D/S: E(CH, DT, FR, GB, IT, NL, SW, BE).

A thermoplastic crosslinkable copolymer is produced by reacting an active-hydrogen-contg. initiator at 25-300°C with a molar excess of a monomer mixt. comprising (A) 90-99.5 wt.% of a lactone of formula:



$$R-CH-[C(R)_2]_n-C=O$$

(where n is 3-6; ⩾ n + 2 R gps. are H, and any remaining R gps. are 1-10 C alkyl) and (B) 0.5-10 wt.% of a polyfunctional acrylate monomer.

The copolymer can be crosslinked by exposure to ionising or actinic radiation or by free radical peroxide catalysts. The degree of crosslinking can be controlled to produce a material which is thermoplastically processable and displays modified rheological props. which make it more easily processable than the corresponding lactone homopolymer. E.g. the polymer may be crosslinked by ionising radiation to a controlled degree to allow it to be blow-extruded into a film or to be extruded into a sheet. A particular application is in the formation of orthopaedic casts and splints as described more fully in EP---3845.
23.2.79 as 100554 (36pp914).

A surgical drape is of flexible material and has two windows each of which is covered on the upper surface by a polymeric film. The films are coated on their lower surfaces with pressure sensitive adhesive which are protected before use by a removable cover.

On the upper surface of each film there is a conduit through which suction tubing, or electrical wires can be threaded and held in position. The drape is pref. T-shaped and has a reinforcing panel surrounding the windows.

The drape can be used in cardiovascular surgery.

Compsn. for cleaning solid surfaces, esp. vehicle bodies vehicle interiors, railway rolling stock, cycles, motorcycles etc. comprises (by wt.): 23-27.5% anionic surfactant, 3-10% polyoxyethylated synthetic fatty acid monoethanolamides, 3-10% caprolactam, 3-10% alkylene glycol, 0.5-1% carboxymethyl-cellulose, 2-10% Na silicate, 8-18 % Na tripolyphosphate 3.5-6% adipic acid, 2.5-5% $(NH_4)_2CO_3$, 0.1-0.2 odoriser and balance water. The compsn. has excellent cleaning power.

Prefd. anionic surfactants are alkyl sulphonates and sulphates, and prefd. alkylene glycol is diethylene glycol. Volskaya S.A., Sheinakhova V.S., Shtokalov F.V. et al Bul. 44/30.11.78 17.7.75 as 159271 (3pp314)

PROC ★ D25 66275B/36 ★US 4165-334
Zwitterionic surfactants contg. sulphonium gp. - are free of nitrogen and phosphorus and do not require builders

CPI INDEXES

ALERTING PATENTEE INDEX (II)

Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

CPI CLASS INDEX (IV)

Weekly only. Headings are all the CPI classes within the section to which an Alerting Bulletin relates, arranged in numerical order. Posted under each class heading is a list, in country then patent number order, of all basic or equivalent documents referenced or cross-referenced under that heading.

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
A+	Polymer Applns.	G	Printing, Coating, Photographic Chemistry
AE	Polymer & General Chemistry	H	Petroleum
B	Pharmaceuticals	J	Chemical Engineering
C	Agricultural Chemistry	K	Nucleonics, Explosives, Protection
D	Food, Disinfectants, Detergents	L	Refractories, Ceramics
E	General Chemistry	M	Metallurgy
E+	General Chemistry Applns.		

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

YNN D11 12156S/07 =DS 1937-433
Chemically-and yeast risen baked goods - improvement
DYNAMIT NOBEL AG 23.07.69-DT-937433
*(06.09.79) *DT1937-433 +A21d-02/16*

Baked goods raised by baking powder or yeast are improved by using an emulsifying mixt. to form the dough. The emulsifying mixt. is an interesterification prod. or mixt. of 60-95 mole% mono- or partial glycerides of 12-22C satd. fatty acids and 40-5 mole% of esters of pref. acylated, edible, hydroxyacids with the partial esters or mixts. of the partial esters with the edible hydroxy acids. 23.7.69 as 937433 (8pp068)

WINK D11 73118V/42 =DS 2315-418
Hot gas circulation multi deck baking oven - for bread prebaking and finish baking after temperature reduction
FR WINKLER SPEZ KG 28.03.73-DT-315418
*(06.09.79) *DT2315-418 A21b-01/26*

A multideck oven for bakeries, based on the circulation of heating gases has, between the ventilator and the burner, an adjustable flap valve to control the share recirculated and passed to the chimney. Upstream of the entry to the decks, a fresh air inlet is fitted with another flap valve.

By suitable position of the two flap valves, the full heat during baking can be lowered in a few mins. to the desirable temp. for finish baking. 28.3.73 as 315418 (3pp39)

FRRR D11 90091Y/51 =DS 2736-838
Baba type fancy cake - comprising cellular bread allowing greater alcohol impregnation
FERRERO P & CIA SPA 07.06.77-IT-068308 (17.08.76-IT-069028)
*(06.09.79) *BE-857-760 A21d-13/08*

Cakes are prepd. flavoured with liquer contg. $\geqslant 35\%$ ethanol and 35% sugar and coated with a layer contg. $\geqslant 30$ wt.% fat, e.g. chocolate. A dough is prepd. from wheat flour, sugar, yeast, protein (including gluten) and water.

The dough in the form of a thin layer $\ngtr 1$ cm thickness, is allowed to rise and is then cooked under controlled conditions of temp. and moisture content. The resulting slab is impregnated with liquer (at least 1 pt. liquer to 1 pts. cake) cut into pieces and coated with a fatty layer. 16.8.77 as 736838 (10pp068)

INTT ★ D11 66560B/37 ★DT 2906-803
Edible moisture-barrier coating for doughnuts - and other baked and fried foods contains aq. poly)saccharide or dextrin soln. emulsified in oil NL 30.8.79)
DEUTSCHE ITT INDS 28.02.78-US-881935
(06.09.79) A21d-15/08 A23d-05

Edible coating forming a moisture barrier on relatively porous surface of baked goods or fried foods consists of a water-in-oil emulsion or colloidal dispersion of (a) an acetylated monoglyceride, a triglyceride in conjunction with an emulsifier and a fat or wax in conjunction with an emulsifier as oil fraction, (b) a (poly)saccharide or dextrin and (c) water, constituents (b) and (c) being dispersed uniformly as droplets in the oil fraction.

The coating is esp. useful for doughnuts made from yeast dough to prevent them becoming stale rapidly. Variation of the compsn. makes it suitable for other baked and fried foods, e.g. sweets, cakes, bread, etc.

The coating pref. contains 27-65% oil, 40.5-30% (poly) saccharide or dextrin and sufficient water to form a satd. soln. It can also contain ca. 1.3% aroma. 22.2.79 as 906803 (31pp016)

MICH/ ★ D11 66603B/37 ★FR 2410-438
Bakery scarifying decorator for top surfaces of dough pieces - replaces skilled manual operation without loss of quality
MICHEL J C 30.11.77-FR-036070
(03.08.79) A21c-11/12

The scarifying machine automatically cuts repetitive, decorative incisions in the top surfaces of dough pieces. Formed dough pieces are conveyed longitudinally beneath a scraifying head. The head comprises a support frame which is reciprocated in a horizontal plane, laterally at right angles to the longitudinal axes of the dough pieces.

Suspended from the frame, at least two feeler arms, fitted with scarifying blades, e.g. commercial razor blades, are continually raised and lowered. The vertical reciprocation is synchronised with the lateral reciprocation and with the conveyor progression. Each time an arm descends, its blade cuts an incision in a longitudinally advancing dough piece as the blade is displaced sideways of the piece.

The device is intended for mfg. loaves of bread, partic. french. stick loaves. The decorator can be adapted for any scale of industrial bakery as well as for manual prodn. 30.11.77 as 036070 (14pp448)

BIAN/ ★ D11 B/37 ★IT 1031-104

CAPS- ★ D11 66979B/37 ★J5 4098-352
Additive compsn. for bread prodn. - comprises yeast, adjuvant, reducing agent and fine granular functional additive and is encapsulated in gelatin
CAPSULE PRODS INC 17.01.78-JA-002743
E19 (D16 E33 E34) (03.08.79) A21d-02

The additive compsn. comprises an ellipsoid-shaped, gelatine capsulated prod, having separable top end and bottom end which contains (a) a yeast, (b) an adjuvant for adjusting a bread texture, (c) a reducing agent and (d) 1 mg- 5 mg of fine granular functional additive. The functional additive includes calcium bromate, calcium iodate, potassium bromate, potassium iodate, calcium peroxide, acetone peroxide, azo-carboxylic amide, ascorbic acid, ascorbate ester, glutathione, protease and amylase.

The additive compsn. can produce bread and cake having superior homogenous quality. 17.1.78 as 002743(6pp15)

✓**PUTT/ ★** D11 67360B/37 ★NL 7802-195
Prepared cake baking mixture production method - grinds and surface dries e.g. spices and dried fruit before mixing with dough
PUTTER W H 28.02.78-NL-002195
(30.08.79) A21d-02/36

Before the dried fruit such as currants etc. are added to the dough they are ground or stirred to break them into particles, which are shaped and then surface-dried, after which they are added to the dough and mixed with it.

Baking can be carried out in a closed mould. The process allows the currants etc. to be distributed throughout the entire cake. 28.2.78 as 002195(3pp160)

MOFO= ★ D11 67618B/37 ★SU -636-532
Laboratory dough rolling machine - has rolling-out rollers and rolling-up drum, which contains elastic strip, and groove with disc which forms the balls
MOSC FOOD IND TECH 07.01.76-SU-313455
A89 J04 R16 (10.12.78) A21c-03 G01n-33/10

Laboratory dough-forming machine comprises a drive, rolling-out rollers, rolling-up drum, and rounding-off device. The quality of the dough during forming is improved by fitting the rolling-up drum with an elastic strip, one end of which is fastened above the rounding-off device which comprises a circular groove and disc. These are

mounted vertically so that a gap forms between them to allow the dough blanks to enter. The disc can rotate, and the rolling-out rollers are connected to the rolling-up drum by means of the drive belt. The working surface of the disc is covered with a flexible material, pref. edible resin, with the circular groove made from a transparent material, such as 'perspex' (organic glass). The circular groove also has a screw to control the gap between it and the disc.

Lasagne noodle formed as elongate ribbon - with transverse corrugations terminating short of ribbon edge
GREEN GIANT CO 05.01.78-US-867092
(28.08.79) A23l-01/16

A lasagna noodle comprises a straight elongate ribbon of the lasagna paste, formed with corrugations. The corrugations extend transversely across the width of the ribbon but have a length less than the total width of the ribbon. At least some and pref. all corrugations are closed at their ends.

Pref. the ribbon is flat on both of its surfaces and the corrugations rise above and below the surfaces. The lasagna noodle is used with a conventional sauce but there is better compacting of the noodles with adjacent noodles. The noodle may be mfd. using existing equipment but altering the extrusion dye to produce a drag on the outside marginal edges. 5.1.78 as 867092(4pp295)

TOSU- ★ D11 67916B/37 ★US 4166-139
Instant, cupped noodles prodn. - by frying in inverted perforated metal cup, drying and placing in storage cup
TOYO SUISAN KAISHA 22.07.76-JA-087602
(28.08.79) A23l-01/16

Instant cupped noodles are produced by placing a mass of noodles in a liq.-permeable metal cup. The cup has a tapered cross section and has a liq. permeable lid covering the wider upper end. The cup is inverted in heated oil for drying the contained mass of noodles. The noodles rearrange themselves to a dense packing in the bottom of the metal cup and a more open packing in the upper part of the cup.

The metal cup is removed from the oil and the fried mass is removed for drying. The dried mass of noodles are packed in a cup-shaped container having a similar shape to the metal cup but with a slightly larger inner dia. The dense mass of noodles is disposed in the bottom of the cup which is finally sealed.

The method produces cupped noodles which can be consumed after the addn. of hot water. 31.8.78 as 938359 (+18.7.77-US-816893)(6pp295)

D12 : MEAT ; FISH PROCESSING

NMHB ★ D12 66409B/37 ★DS 2847-188
✓Fish filleting machine - with sepg. tools for fatty strips between costal and skinning cutters
NORDISCH MASCH R BAADER 30.10.78-DT-847188
(06.09.79) A22c-25/16

Fish-filleting machine has downstream of the costal cutters a pair of sepg. tools whuch extend from the edges of a guide slot and include an angle of 60-180° with each other. They are immediately followed by a pair of skinning cutters below an endless belt conveyor.

Arrangement ensures that the fatty strips on both sides of the dorsal fins are separated from the flesh before skinning and are discarded during the skinning operation. 30.10.78 as 847188 (5pp39)

NMHB ★ D12 66412B/37 ★DS 2905-518
Double fish filleting machine - with gap between blades for dorsal fins and fin rays
NORDISCH MASCH R BAADER 14.02.79-DT-905518
(06.09.79) A22c-25/17

A skinning machine for double fish fillets includes a left-hand and a right-hand skinning blade. These leave between themselves along the centre line of the belt conveyor a gap for the dorsal fins and the fin rays.

This eliminates the risk of the skin tearing apart between the fillets or the destruction of the dorsal fins which contaminates the fillets. 14.2.79 as 905518 (5pp39)

FARH ★ D12 66505B/37 ★DT 2809-385
✓Sausage meat filling device - with calibrating tube and disc maintaining constant filling dia. by braking action
HOECHST AG 04.03.78-DT-809385
(06.09.79) A22c-11

The filling of sausage meat into an artificial tubular skin is controlled by a calibrating tube over the sausage machine filler tube. The calibrating tube has a conical tulip-shaped extension, made of flexible material, near the filler tube opening. A smoothened part of the gathered sausage skin passes over the outside of the extension which can move relative to a calibrating disc, fixed to the filler tube.

The dia. of the extension is thus varied depending on the variable pressure and this braking effect keeps the sausage dia. constant. Bursting of skins by excess pressure and puckering by too little filling are thus eliminated. 4.3.78 as 809385 (18pp39)

g electrocuting installation with automatic separating door - has
nterlocks preventing entry door from opening unti preceding pig is
lectrocuted
MACH NIJHUIS BV 10.05.79-NL-003682
(31.08.79) A22b-03/06

he pigs are killed by contact with electrodes suspended
etween two parallel inclined endless belt conveyors. The
igs enter the gap between the conveyors at the input end
n a downwardly inclined floor so that, when each pig arri-
es at the electrodes, it is firmly held between the two con
-veyors. In order to separate each pig from the one behind
t, the conveyor is preceeded by a ramp at the end of which
is a vertical sliding door which either entirely blocks the
passage or leaves it entirely free according as to whether
it is raised or lowered.

A prickle electrode is pref. coupled with the door so that, when the door is raised, the electrode lowers and transmits a small electric shock to the rump of the pig encouraging it to pass under the open door. The electrode is then raised again so that the pig behind does not touch it.

The automatic door eliminates the need for a preliminary conveyor for spacing the pigs out and hence also the risk of damage due to a live pig becoming caught between two conveyors. 10.5.79 as 003682(6pp1370)

Biologically stable food, esp. soup concentrate - contains solid reducing water activity and can be diluted easily

CAMPBELL SOUP CO 28.02.78-US-882275

(06.09.79) A23l-01/40

Food prod. for dilution with 9-18 times its wt. of water before consumption contains flavouring and/or aroma, food particles, water to produce a total moisture content of 45-55 wt.% and water-sol. solids to cause a water activity of max. 0.84.

The prod. is specified as a conc. soup prod. It is biologically stable (specifically does not support the growth of bacteria, fungi or yeasts) and can be diluted easily, since it is not dehydrated.

Pref. prod. contains cooked meat and uncooked vegetables, cut into ca. 3 mm dice. It also contains 10-13 wt.% salt. It is produced by mixing the constituents, heating to ca. 93°C, placing the hot mixt. in a container and sealing this and finally heating the sealed container to destroy any fungi or yeasts present, pref. for 3 min. at 90°C. 22.2.79 as 906839 (9pp016)

Snack food prods. prepd. from hydrated flour based material - cooking under press., extruding and then compressing extrudate

GENERAL MILLS INC 27.08.75-US-608135

*(12.09.79) *BE-845-556 A23l-01/10*

Snack foods such as chips and puffs are mfd. by cooling an hydrated farinaceous material of 13 - 25% moisture to produce a dough, extruding the dough to both reduce the moisture content to 5 to 12% and to increase the volume by 3 - 7 times, and compressing at least portions of the extrudate to substantially reduce the cross-section when still pliable.

The cooling is pref. carried out at 235 - 350°F at a pressure of 500 - 1500 psig. The material is pref. a mix. of corn, rice, potatoes and a flavouring. After compression, the extrudate pref. has an irregular, patterned surface. 16.8.76 as 034014 (3pp1376).

RICT D13 14040A/08 =GB 1552-277

Blemish-preventing compsn. for apples, esp. with red skins - contg. light-absorbing agent and opt. biologically active cpds.

RICHTER GEDEON VEGY 28.10.76-HU-RI0600 (19.08.76-HU-RI0595)

*C03 E19 (12.09.79) *BE-857-947 A23b-07/14*

Apple peel partic. Jonathan peel spot is reduced by treating the apple with ≥1 light protective agent. Pref. the agent comprises light screeners, quenchers, radical scavengers and/or peroxide decomposers.

Specifically the light screener is Zn oxide and/or Ti dioxide. Alternatively the agent is (di)benzophenone deriv. benzotriazole deriv., tris triazolobenzene deriv., aromatic ester, substd. acrylonitrile deriv., organometallic cpd. and/or alicyclic dienone deriv..

A single treatment is sufficient to prevent the peel spot. The treatment is long-lasting i.e. the apples may be stored during winter. Toxicity of the agent is very low. 18.8.77 as 034766 (27pp924).

ISHI/ ★ D13 66645B/37 ★GB 1552-348

Mfr. of re:heatable pre-boiled rice - by boiling, freezing and reheating to 0-10 degrees C

ISHIDA Y 12.12.75-JA-147465

(12.09.79) A23l-01/18

Pre boiled rice which is reheatable without loss of flavour or form, is made by boiling the rice to convert substantially all the starch to the α form, breaking the rice into clusters, drying it if necessary, rapidly freezing the rice and then allowing it to warm to 0 - 10°C. Pref. freezing is effected in a commercial freezer, down to below -15°C. Alternatively the rice may be sprayed by liquid nitrogen. Drying may be effected by air.

The rice may be stored at room temperatures for long periods in conventional plastics or foil pouches. Alternatively storage may be effected in a domestic refrigerator or the like. 6.9.76 as 036860 (7pp525).

Food preservation agent contg. ascorbic acid (salt) - with alkali charbonate hydrate and opt. anhydride and other additives
TOPPAN PRINTING KK 19.01.78-JA-004734
E13 (E34) (03.08.79) A23l-03

An agent to preserve freshness is composed of (a) ascorbic acid or its salt as major ingredient, (b) alkali carbonate hydrate or the mixt. of alkali caronate hydrate and alkali carbonate anhydride and (c) additives.

Ascorbic acid and its salt can absorb oxygen under alkaline condition in the presence of water. In the agent, water can be released from alkali carbonate hydrate and alkali carbonate can be decomposed with the additive to form CO_2 gas. Further the amt. of released water can be controlled freely by changing the proportion of alkali carbonate hydrate and alkali carbonate anhydride and the amt. of formed CO_2 gas can be controlled by replacing a part of alkali carbonate with calcium hydroxide. The agent allow the concn. of O_2, CO_2 and water in a package to be controlled and so that foods in the package can be kept fresh for long time.

As ascorbic acid or its salt L-ascorbic acid, D-isoascorbic acid and their sodium salts can be used. As additive ferrous sulphate, ferrous chloride, ferrous chloride hydrate, active carbon, bentonite, zeolite, activated clay, etc. can be used. Usually alkali carbonate is used 0.5-2 pt. wt. on 1 pt. wt. of ascorbic acid. 19.1.78 as 004734(4pp5)

Prodn. of water-retaining miso free of discolouration - by mixing with pullulan and opt. condensed phosphate to stabilise quality
POLYPHOS KAGAKU KEN 20.01.78-JA-004942
(03.08.79) A23l-01/20

The method comprises combining pullulan opt. mixed with condensed phosphate in 'miso'. Pullulan is combine in an amt. of 5.0-0.1 w/w% in 'miso'. Pullulan and condensed phosphate are mixed in wt. proportion 1:1 and usually condensed phosphate is present in an amt. of 0.5 w/w% in miso'. Pref. condensed phosphate is the mixt. of Na hexametaphosphate 80% and K metaphosphate 20%.

The pullulan prevenrs the discoloration of 'miso' and improves water-holding property of 'miso' better than conventional additives. The mixt. of pullulan and condensed phosphate is highly viscous. Thus the quality of 'miso can be stabilised without deteriorating its taste and flavour and physical properties. 20.1.78 as 004942(3pp5)

Oxygen absorbent for use with food - comprises ferrous acetate and sodium sulphate deca:hydrate
TEIJIN KK 25.01.78-JA-006130
E36 (06.08.79) B01d-53/02 B01j-01/22 C01b-13

The oxygen absorbent is used in a vessel (which is closed tightly) for a substance e.g. a food (which is likely to rot, decompose, change in quality etc., by contacting O_2). The absorbent agent absorbs O_2 smoothly without radical heat emission or emission of dangerous gas e.g. SO_2.

The absorbent is pale blue-green originally, and changes its colour to brown when it absorbs O_2. The absorbent can also be applied to an O_2 detector using the said colour changing characteristics. 25.1.78 as 006130(4pp55)

TEIJ ★ D13 67209B/37 ★J5 4099-792
Oxygen absorbent for hermetically sealed food containers - comprises ferrous acetate, sodium sulphate deca:hydrate and a filler
TEIJIN KK 25 01.78-JA-006131
E36 (06 08 79) B01d-53/02 B01j-01/22 C01b-13

An oxygen absorbent comprises a ferrous acetate, NA_2SO_4 $10H_2O$, and a filler. The oxygen absorbent is used in a vessel which is hermetically sealed for a substance such as a food (which rots, decomposes, changes in quality, etc.) to absorb the O_2 in the vessel effectively and to prevent the substance from eeteriorating.

The oxygen absorbent absorbs the O_2 without a radical heat emission, or emission of a gas such as SO_2. The absorbent shows pale blue-green originally, and changes its colour to brown when it absorbs O_2, thus the O_2 absorption process can be followed, hence, the freshness of the contents of the package can be determined. The absorbant can also be used as an O_2 detector in a certain atmos. using the colour changing characteristic. 25.1.78 as 006131(4pp)

TEIJ ★ D13 67210B/37 ★J5 4099-793

Oxygen absorbent for food containers and detectors - comprises ferrous acetate and sodium carbonate, providing colour change with oxygen absorption

TEIJIN KK 25.01.78-JA-006132

E36 (06.08.79) B01d-53/02 B01j-01/22 C01b-13

Oxygen absorbing agent comprises Fe (II) acetate and Na carbonate .10 H_2O. The agent is used in a vessel (which is closed tightly) for foods (which is likely to rot, decompose on contact or reaction with oxygen), in order to absorb the oxygen in the vessel effecitvely and to prevent the substance from rotting etc.

The agent absorbs the oxygen smoothly without radical heat emission, nor emission of a dangerous gas such as SO_2. The agent is pale blue-green in colour, and changes to brown on absorption of oxygen. Thus the oxygen absorption process can be traced and the freshness of the contents of the package can be determined. The agent can also be applied to an oxygen detector in a certain atmos. 25.1.78 as 006132(4pp55)

TEIJ ★ D13 67211B/37 ★J5 4099-794

Oxygen absorbing agent e.g. the use in food containers - contains ferrous acetate, sodium carbonate deca:hydrate and a filler, and changes colour on absorption of oxygen

TEIJIN KK 25.01.78-JA-006133

E36 (06.08.79) B01d-53/02 B01j-01/22 C01b-13

The O_2 absorbing agent is used in a sealed vessel contg. food, to prevent rotting, changes in quality etc. on contact with O_2.

This agent absorbs the oxygen smoothly without much heat emission, nor emission of a dangerous gas such as SO_2. The agent is pale blue-green originally, and changes its colour to brown when it absorbs oxygen, thus the oxygen absorption process can be visibly traced, hence, the freshness of the contents of the package can also be determined. This agent can also be applied to an oxygen detector in a certain atmos. using the colour changing characteristic. 25.1.78 as 006133(4pp55)

Synthetic fats prodn. - using oil-in-water emulsions of fats, oils and cold and hot coagulating protein(s)
AJINOMOTO KK 21.06.76-JA-072934
*(21.08.79) *J52156-959 A23d-05 + A23j-03*

First oil-in-water emulsion composed of oil and fat, heat-coagulating protein and water is mixed with second oil-in-water emulsion composed of oil and fat, cool-coagulating and heat-dissolving protein and water.

Thus fat-like material which is similar to animal fat in appearance, taste, flavour and texture, can be prepd. artificially. The prod. can be combined with synthetic meat to give excellent taste and flavour and capable of being frozen without detriment to its quality. As oil and fat animal or vegetable oil and fat can be used, and through animal oil and fat contains cholesterol it can give fat excellent in taste and flavour. As heat-coagulating protein soy bean protein, egg white, gluten, etc. can be used, and as cool-coagulating protein gelatin and collagen can be used.

It is desirable to make the first emulsion in the form of the emulsion curd. The first O/W type emulsion is prepd. from oil and fat, heat-coagulating protein and water used in wt. ratio 1:0.5-5:2-10, pref. 1:1 3:3-5. The second O/W type emulsion is prepd. from oil and fat, cool-coagulating and heat-dissolving protein and water used in wt. ratio 1:2 10:5-20 pref. 1:3-5:10-15. The first emulsion and the second emulsion are mixed in wt. ratio 7-4:3-6. 21.6.76 as 072934 A23j-3/00, A23d-5/00 (21.8.79) AJINOMOTO KK (3pp)(J52156959)

Candy filling - having stabilised aroma
CANADIAN PAT & DEV LTD (MIAC) 08.03.74-CA-194449
*(21.08.79) *J50125-065 A23g-03 + A231-01/09*

Candy filling is obtd. by heating a sugar-contg. mixt. to form sugar polymers, without browning or caramelising diluting the prod. with water to ca. 85-95% sugar content, cooling the diluted prod. and forming it into a smooth paste, and blending the paste with the desired aroma and flavour essence.

The sugar polymers may be oligosacchardies of D.E. 25-45, e.g. maltodextrin. Binders such as glycerol and polyethylene glycol may be added to assist the blending process.

The aroma and flavour are retained well by the polysacchardies. 7.3.75 as 027921 (clg.8.3.74-CA-194449) A23g-3/00;A231-1/09 (21.8.79) CANADIAN PAT & DEV LTD; (6pp)(J50125065)

Neutralised vegetable hydrolysate prodn. - by first treating with anionite, and then with lime milk and ammonia, to prevent pptn. of gypsum, used in biochemical processing

GELFAND G D .31.01.77-SU-449130

(10.12.78) C13k-01/04

Vegetable hydrolysates are neutralised before further biochemical processing with lime milk and finally, with ammoniacal water.

The prepn. includes preliminary treatment of hydrolysate (before liming) with an anionite until the acidity drops to 65-95 mg. equiv./l.; sepn. of anionite, and the neutralisation with lime milk to residual acidity of 45-75 mg. equiv./l.

By this method, precipitation of gypsum mud is prevented; the consumption of lime milk is reduced, and the effectiveness of the process is enhanced.

Bucket conveyor - with means to move the buckets into contact during horizontal working runs

YAMATO H 15.12.75-JA-150067 (07.08.75-JA-096374)

(28.08.79) A23l-01/16

Bucket conveyor comprises a series of buckets connected at their sides to a pair of driving chains. The connection is effected by spaced first links of the chains, between which first links sets of second links not connected to the buckets are located.

During horizontal running, rollers carried by the first links run along tracks which do not support the sets of second links so that the second links can hang in an unextended configuration allowing the buckets to touch. For running with the buckets spaced, for example on vertical runs, or when the chains pass over sprockets, the tracks support all the links and thus the sets of second links are extended and the buckets moved apart.

Contact of the buckets along a working run enables more buckets to be present at any one time in the working run and thus output is enhanced. Used in the mfr. of cooked noodles by passing the buckets through a succession of cooking baths. 28. 7. 76 as 257957 (13pp525)

Calender having a number of cylinders coacting with one another and forming nips has each of the cylinders provided with a flexible sleeves rotatable about fixed cores and pressed into nip formation by pads. Pads of nip forming sleeves are connected to the same fluid supply source via lines, whereby the pressure in lines for nips formed by cylinders disposed in a common horizontal plane is equal and, the line for the cylinder which is disposed above its corresp. nip forming cylinder is provided with a pressure regulator to compensate for cylinder flexure induced by gravity.

Used for processing particulate or pasty materials such as foodstuffs, pigments or plastics materials. Pref. grinding cocoa beans for mfg. chocolate. Constant linear pressure at the nip of all cylinders disposed in different horizontal planes is warranted. In case of chocolate sandy taste or excessive fattines are prevented by grinding within the size of 15-25 µ. 10.3.78 as 810507 (16pp536)

Chamber for radioactive irradiation of granular animal feed, etc. - gives continuous distribution for uniform radiation dosing of all prod.

SULZER FRERES SA 01.12.77-CH-014698

K08 (03.08.79) A23k-01 B01j-01/10

The installation comprises a vertical cylindrical irradiation chamber, contg. a coaxial, vertical, cylindrical support for radiation sources. Conveying equipment is included which carries the prod. successively over both circumferential surfaces of the support.

One vertical shaft rotary agitator is mounted inside the cylindrical support and another inside the annular space between support and chamber wall. These agitations rotate about their respective vertical axes and the axes themselves are rotated about the central axis of the irradiation chamber.

Continuous conveyors e.g. feed screws, are fitted to charge and discharge material to and from the irradiation chamber. One conveyor is linked to the inside of the radiation source support and the other conveyor is linked to the annular space and between support and chamber wall.

The irradiation chamber pref. has a top screening cover on which is mounted motor-driven planetary gearing to drive the agitators. Air under pressure is pref. introduced to fluidise prod. in the irradiation chamber.

The prod. is passed continuously through the chamber and distributed over the radiation source support so that all the prod. receives a similar dose of irradiation. 17.1.78 as 001270 (13pp448)

Cyclone for pneumatic fodder components mixing - has rib guides on inner surface of bell to scatter fodder evenly over bunker area useful in animal, e.g. cattle, breeding
BELYAEVSKII YU I 10.03.76-SU-333987
P41 (06.12.78) B04c-01/10

The cyclone comprises a casing contg. a receiving chamber, central tube and bell at the bottom.

For even scattering of the fodder, there are rib guides on the inner surface of the bell.

The fodder mixt. from the pneumatic system is fed under pressure into the receiving chamber, where air and fodder are separated by their rotary motion and friction of the fodder against the walls. The flow of fodder rotating on the inner conical surface of the cyclone enters the guides and is scattered evenly over the bunker as it leaves the aperture in the bottom. The guides can be set appropriately for the filling of a bunker of any shape.

Device for packaging plastic consistency products - has pusher-rod drive in form of a beam so that roller can interact with pusher rod
ODESS FOOD TECH INS 26.01.77-SU-447645
Q31 (18.12.78) B65b-25/06

Device for packing plastic prods. comprises a mechanism for supplying the packing material, shaping mechanism proportionator, rotor with hollows, having raising-lowering pusher-rods with a drive, and a mechanism for closing up the packed material. Productivity is increased and operation is more reliable, by making the drive for the pusher-rod as a beam having drive cams, connecting rods, and a template, fastened to the rods, so that a roller can interact with the pusher-rod.

Packing strip is drawn from a roll, fed over a guiding roller, and pressed by a pressure strip. The packing mechanism draws off a predetermined length of film, while a needle mechanism applies the required data markings to the film. The film passes between knives which cut it to length. The length is guided to the punching die for shaping, and after being placed in position, it is formed into a box shape and dropped into one of the hollows in the rotor.

Automatic detoxification of waste liquor contg. nitrite ions - by oxidn. to nitrate using hydrogen peroxide under slightly acidic conditions
DEUTSCHE GOLD & SILBER 05.12.78-DT-852475
(06.09.79) C02c-05/04

Automatically controllable detoxification of waste liquor contg. nitrite ions is effected by oxidn. to nitrate ions, using H_2O_2 under slightly acidic pH conditions. During oxidn. the H_2O_2 is added continuously or in portions, with continual monitoring of the pH, addn. being stopped when it no longer causes a further redn. in the pH value.

Liquors contg. an unknown quantity of nitrite ions can be completely detoxified, without wasting H_2O_2.

Pref. the liquor is adjusted to pH $\not> 4.0$ before addn. of H_2O_2 or after addn. of (part of) the H_2O_2 needed for complete oxidn. of the nitrite ions present. If the H_2O_2 is added in portions, each addn. amounts to $\geqslant 0.1$ g H_2O_2 (100%)/1 liquor. Addn. in portions is controlled electronically. 5.12.78 as 852475 (4pp016)

HOFF/ ★ D15 66442B/37 ★DT 2808-519
Oxygen dispenser for fish tanks - comprising a mixt. of potassium peroxo:mono:sulphate, sodium perborate and sodium carbonate surrounded by plastic foil
HOFFMANN K 28.02.78-DT-808519
E34 (E31) (06.09.79) A61k-07/48 A61k-33 C02b-07 C02d-01

An oxygen dispenser for the enrichment of oxygen in water comprises a shaped mixt. of potassium peroxomonosulphate, sodium perborate and sodium carbonate opt. together with a binder, the whole mixt. being partially or completely surrounded by a plastic foil. The container may also be of glass.

On contact with water, the dispenser gives off molecular oxygen in the form of fine bubbles. The dispenser can be used to aerate water in fish tanks and ponds, where unlike conventional aeraters, it will enrich the water in the bottom of the tank and round the edges, rather than just the surface and central water. The dispenser can also be used in bath water for cosmetic or medicinal purposes. Oxygen baths promote the circulation of blood and stimulate metabolism. The simultaneously formed sodium borate acts as a water softener. Compared to pressed tablets, the dispenser can be kept longer, also it will not decompose due to air or dampness. 28.2.78 as 808519(3pp1401)

FARH ★ D15 66469B/37 ★DT 2808-961
Purifying waste waters contg. water-soluble metal salt(s) - esp. copper salt, by contact with finely-divided yellow phosphorus
HOECHST AG 02.03.78-DT-808961
M25 (06.09.79) C02c-05/02

Waste waters contaminated with a water-sol. salt or salt mixt. of Cu, Ag, Au, Pt, Pd, Ir, Os, U, Se, Te, As, Sb, or Cd, are purified by contact with finely-divided yellow P. The process can be used in neutral to acid waste waters having a high content of sol. metal-, esp. Cu salts. In alkaline soln., P is oxidised to H_3PO_4. In the presence of a high metal salt concn., the acids released can be used for phosphate mfr., e.g. for fertilisers. The process can also be used for dechlorinating water in the Cu industry, by depositing CuCl on the yellow P.

The process is effective for waste water purification as well as for Cu recovery from conc. solns. 2.3.78 as 808961 (12pp200)

Sedimention system for sludge separation - having flat elements which can move from side to side to allow removal of deposits
PASSAVANTW MICHELBACHER 02.03.78-DT-809068
J01 (06.09.79) B01d-21

Sedimentation system for suspensions consists of a large number of channels of small height mounted parallel to each other. These have horizontal or inclined surfaces below upon which the sediment collects. These surfaces can be moved from side to side to transport and remove the accumulated sludge.

The surfaces can be moved from the horizontal to the inclined position to achieve the sludge removal. The elements can be interlinked so that the surface of one element serves to move the sludge into the run off passages.

Used for removing solids from suspensions. Gives improved sludge removal and movement. 2.3.78 as 809068 (24pp1053)

VOLK- ★ D15 66541B/37 ★DT 2905-347
Microbiological liq. manure purification to avoid pollution - by aerobic fermentation of undiluted material charged intermittently to mixing tank having sloping floor
VOLKSEIGENES GUT 28.02.78-DL-203888
(06.09.79) C02c-05/10

Undiluted animal refuse-derived liq. manure contg. $\leqslant 7.2$ % solids, at a reduced crude fibre proportion, is charged intermittently into a mixing tank, the floor of which has angle of inclination 5-20°. Air is charged 10-30 cm from the activated sludge tank floor, evenly distributed along the longitudinal edge, through an opening cross-section of 5-10 mm of air outlet orifices and under 5-25 K Pa pressure.

Hourly air quantity is 1-5 x vol. of activated sludge tank. Width : filling level ratio of activated sludge tank is 1 : 0.87 to 1 : 0.97. The activated sludge flocculate has pH 5.6-9.4. The temp. difference between air temp. and activated sludge tank content temp., measured 1 m below activated sludge tank liq. level, is 0-32°C, but is $\geqslant 10$°C at -15°C. Sludge concn. measured after 30 min. settling, is 300-900 ml/1. Dwelling time in activated sludge tank is 6-20 days at min. foam thickness 20-100 cm.

The prod. is then continuously emptied into a clarifying zone. A parameters of air pressure, air quantity, pH, sludge concn., dwelling-time and emptying are programmed automatically, variably and continuously.

Microbiological liq. manure purificn. for further agricultural use takes place in one step, without environmental pollution. The prod. can be used directly and/or stacked for a longer time without further processing. 13.2.79 as 905347 (8pp200)

Liquid purification by flotation process - having precleaning by filtration followed by flocculation and injection of finely divided air bubbles
TATABANYAI SZENBANYAK 24.02.78-HU-TA1476
J01 P41 (06.09.79) B03d-01/02

Initially coarse impurities are removed by prefiltration. Then flocculating agents are added to the mixt. to coagulate the impurities. The liq. is then allowed to flow from the top to the base of a column, up which air bubbles are passed.

The air is introduced into the liq. and finely divided, the bubble being 0.05-0.2 mm. The pptd. or flocculated impurities stick to the surface of the bubbles and are removed from the top. The clarified liq. is removed from the base.

Used for purifying liqs. esp. effluent streams. The system allows this to be done by direct injection from air without the use of a compressor. 23.2.79 as 907146 (22pp)

HYDR- ★ D15 66611B/37 ★FR 2410-496

Multi-passage extruded plastic tube e.g for biological filter - has perforations so that extrusion cooling air can reach all passages

HYDRO SYSTEM SRL 05.12.77-IT-030384

A88 J01 Q42 Q67 (03.08.79) B01d-35/02 C02c-01/02 E02b-11 F16l-09/18

The element is of the type which is extruded in tubular form with outer circumferential wall contg. longitudinal partitions which intersect to make longitudinal passages. Holes are made through the outer wall and at least some of the partitions sot that a pressurised fluid surrounding the element would flow into the passages. Holes through the outer wall are pref. on axes radial to the axis of the extrusion. This facilitates entry of nozzles to deliver a cooling fluid, e.g. compressed air or gas. The extrusion is pref. subjected to torsion which orientates the passages helically w.r.t the longitudinal axis of the element.

The biological filter element is used for purificn. of waste water. The element can also be used as packing for mass transfer operations. The holes facilitate uniform air cooling of walls and partitions during extrusion. This overcomes the current problems of uneven cooling which can lead to stresses deforming the thin walls and partitions. Walls and partitions can safely be made even thinner to reduce wt. and save material. 5.12.78 as 034174 (7pp448)

Plant for thickening and drying sewage sludge - without pressing and without atmos. pollution by bad smells

SOCEA EAU ASSAINI 02.12.77-FR-036429

(03.08.79) C02c-03

The sludge is transfered under pressure into a closed reaction vessel at >160°C (pref. about 180°C). The reactor comprises a vertical, cylindrical pressure vessel with high level inlet for sludge. As the sludge is thickened, it is gently agitated. In the base area of the vessel, thickened sludge is continually displaced radially towards the axis of the vessel, where it is discharged through the base of the vessel.

Agitation is pref. effected by long thin rods suspended vertically through the sludge from a supporting, radial arm rotating slowly about the axis of the vessel. Radial displacement of thickened sludge pref carries it into a coaxial sump below the vessel base. The sump are a centri-fugal rotor which expells the sludge radially or trangentially. The reactor pref. operates at a pressure of about 10 to 12 bars.

Used for thickening and drying sewage sluge ready for disposal, pref. by incineration.

The sludge can be economically brough to a solids content of 30% or more compared with about 15% by existing reactors. The process does not allow unpleasant smells to pollute the atmos. 2.12.77 as 036429 (10pp448)

Converting H-type ion exchange resin to magnesium type - by treating with aq. soln. of magnesium cpd. in presence of ammonia
UNITIKA KK 19.01.78-JA-005057
A91 J01 (01.08.79) B01j-01/08

A chelating ion exchange resin having a hydrogen atom at the end of its functional gp. is directly converted to a Mg-substd. resin to prevent shrinkage of the chelating ion exchange resin during adsorption of heavy metal ions, without converting previously the H-type ion exchange resin to the Na-type ion exchange resin, by treating it with an a . soln. of a Mg cpd., e.g. $MgCl_2$, $Mg(OH)_2$, $MgSO_4$, $Mg(NO_3)_2$, Mg carbonate or Mg hydrogen carbonate, at a pH of 9-12 in the presence of ammonia.

In an example, 60 ml of a H-type chelating ion exchang resin, Unicellec UR-30 (RTM) charged into a glass-made column having an inner dia. of 20 mm, after which an am -oniacal MgCl soln. (pH=12) comprising 7 grams of $MgCl_2$ 9 grams of 28%-ammonia water and 100 ml of H_2O is passed upwardly therethrough under circulation for 2 hrs. at SV of 5(1/hr), followed by passing downwardly therethrou 500 ml of H_2O at SV of 10 (1/hr) to give a Mg-type chelating ion exchange resin. 19.1.78 as 005057(4pp34)

NIRA ★ D15 66866B/37 ★J5 4097-57
Converting H-type chelating ion exchange resin to calcium - b treating with a calcium cpd. in the presence of ammonia
UNITIKA KK 19.01.78-JA-005058
A91 J01 (01.08.79) B01j-01/08

A chelating ion exchange resin having hydrogen atom at th end of its functional gp., is directly converted almost in 100% yield to a Ca-substd. resin to prevent shrinkage of the chelating ion exchange resin ad sorption of heavy meta ions, without converting previously the H-type ion exchange resin to the Na-type ion exchange resin, by treating it with an aq. soln. of a Ca cpd., e.g. $CaCl_2$, $Ca(OH)_2$, CaS $_4$, $Ca(NO_3)_2$, $CaCO_3$ and $Ca(HCO_2)_2$ etc. at a pH of 9-12 in the presence of ammonia.

In an example, 60 ml. of a H-type chelating ion exchange resin sold from NI RA under the commerical name of Unicellec UR-30 is charged into a glass-made column having the inner dia. of 2 mm, after which an ammoniacal $CaCl_2$ soln. (pH=12) comprising 8 g of $CaCl_2$, 9 g of 28%-ammonia water and 100 ml of H_2O is passed upwardly therethrough under circulation for 2 hrs. at SV of 5(1/hr), followed by passing downwardly therethrough 500 ml of H_2O a SV of 10 (1/hr) to give a Ca-type chelating ion exchange resin. 19.1.78 as 005058(4pp34)

JAOR ★ D15 66867B/37 ★J5 4097-579
Sepn. of cationic exchange resin from exchange resin mixt. - by passing sodium hydroxide soln. upwards through resin mixt. to carry anionic resin up column
JAPAN ORGANO KK 20.01.78-JA-004391
J01 (01.08.79) B01j-01/09 C02b-01/76

A cation exchange resin is sepd. from a cation- and anion-exchange resin mixt. in out-tower regeneration of mixed bed-type ion exchange appts. The improvement comprises passing upwardly 2-8 wt.%-NaOH soln. through the mixed cation- and anion-exchange layer at the LV of 0.5-4 m/hr from the under part thereof to form a laminated layer, the upper part of which is an anion exchange resin layer and the under part is a cation exchange resin layer, esp., passing upwardly a NaOH soln., the density of which is between that of both of the ion exchange resins, at a low flowing rate, to rise only the upper anion exchange resin so as to form the NaOH soln. layer having the intermediate density between the rised anion exchange resin and the cation exchange resin, and discharging separately the rised anion exchange resin and the cation exchange resin to the outside.

Both ion exchange resins can be regenerated separately, so the ion exchange resins are not contaminated with unregenerated Na-bearing cation exchange resin or Cl-bearing anion exchange resin. 20.1.78 as 004391(6pp34)

JAOR ★ D15 66868B/37 ★J5 4097-580
Regenerating acid cation exchange resin or basic anion exchange resin - in a tower using upward flowing regeneration agent and requiring fewer control valves
JAPAN ORGANO KK 20.01.78-JA-004392
J01 (01.08.79) B01j-01/09 C02b-01/76

In the regeneration of strongly acidic cation exchange resin or strongly basic anion exchange resin with an upward stream of regenerating agent, the improvement comprises passing an upward stream (I) of regenerating agent, the flow rate of which is such that the ion exchange resin layer is swelled, and another upward stream (II) of regenerating agent, the flow rate of which is slightly lower than that of (I), through the ion exchange resin layer, alternatively and repeatedly within a short period.

The number of valves required is considerably reduced and thus the control mechanism for automated control is simplified. The structure of the ion exchange resin tower is very simple and back-washing is carried-out simultaneously with the ion exchange resin layer being regenerated. 20.1.78 as 004392(10pp34)

HITA ★ D15 66944B/37 ★J5 4098-042
Hydrofluoric acid removal and recovery from waste water - by absorption with activated carbon which is treated with hot water or alkali soln. to recover the acid or sodium or calcium fluoride
HITACHI KK 19.01.78-JA-003700
E36 (02.08.79) C01b-07/22 C02c-05/02

Waste water is adjusted to pH ⩽ 2 and passed through an activated carbon-packed tower or column; and the hydrofluoric acid adsorbed activated carbon is treated with hot water or an alkaline soln. contg. caustic soda, slaked lime etc. at 50°C to recover the hydrofluoric acid or sodium or calcium fluoride.

The method not only recovers hydrofluoric acid from waste water contg. other acids, e.g. nitric acid, etc., but also of greatly reducing the amt. of slaked lime used, as well as reducing the amt. of sludge generated. The method is used for treating waste water from e.g. plating factories, etching of semiconductors, etc. 19.1.78 as 003700(3pp117)

SEKI ★ D15 66945B/37 ★J5 4098-043
Treating waste water contg. starchy substances - by mixing with water soluble high molecular polysaccharide and opt. with an alum etc.
SEKISUI CHEMI IND KK 17.01.78-JA-003995
A91 C04 E33 (C03 D13) (02.08.79) B01d-21/ C02c-05/02*

Waste water, e.g. those discharged from starch-mfg. factories, fermentation factories, food-processing factories, etc., is mixed with a water-sol. high molecular polysaccharide, e.g., xanthan gum, zanflo, etc., which are the fermentation prods. of microorganisms, together with, as needed, an alum, e.g. K alum, ammonium alum, etc., and additive assistants, e.g., powdered shellfish fossil, slaked lime, $CaCl_2$ and locust bean gum.

This method coagulates and sedimenting starchy substances contg. flocs present in waste water, providing very clear treated water of a high transparency. The sepd. flocs can be used in feed or fertiliser. 17.1.78 as 003995 4pp117)

SEKI ★ D15 66946B/37 ★J5 4098-044
Treating waste water contg. starch substances - using glycol ester of alginic acid and coagulation assistant, with by/production of feed or fertiliser
SEKISUI CHEMI IND KK 17.01.78-JA-003996
A91 C04 (A11 C03 D13) (02.08.79) B01d-21/ C02c-05/02*

Waste water contg. starch substances, e.g. those discharged from starch-mfg. factories, fermentation factories, food-processing factories, etc., is treated by mixing the water with a glycol ester of alginic acid, e.g., ethylene glycol alginate, propylene glycol alginate or tri-, tetra-, penta, hexta, hepta-, or octa-methylene glycol alginate, etc., together with coagulant assistants, e.g., powdered shellfish fossil, slaked lime, and calcium chloride.

This method is capable of very effectively coagulating and removing starchy substances-contg. flocs present in water easily and rapidly to give very clear treated water. The sepd. flocs can be used safely as feed or fertiliser. The pref. amt. of the glycol esters of alginic acid is 0.25-1.0 wt.% on the basis of the total wt. of floating substances present in the waste water. 17.1.78 as 003996(4pp117)

MITK ★ D15 66947B/37 ★J5 4098-046
Biologically purifying waste water - includes adding alkali to promote digestion reaction before denitrification
MITSUI TOATSU CHEM INC 18.01.78-JA-003326
(02.08.79) C02c-01/02

Method of biologically purifying waste water contg. ammonia and urea in which the pH waste water in a digestion tank is regulated to 6 to 9 by using a hydroxide, carbonate, or bicarbonate of an alkaline earth metal to cause a digestion reaction to take place by means of a digesting bacteria. Then the water is introduced into a tank where denitrification is carried out in the presence of a reducing agent by means of denitrifying bacteria.

At the same time to convert alkaline earth metal present in waste water into carbonate and/or bicarbonate carbon dioxide gas is introduced from the bottom of the tank. Finally carbonate and/or bicarbonate of the alkaline earth metal is sepd. with activated sludge by sedimentation in a sedimentation tank and then recycled to the digestion tank.

The amt. of neutraliser used is greatly reduced. A constant denitrification efficiency for ammonia and urea can be kept even in case where the quality of the water fluctuates greatly. 18.1.78 as 003326(4pp117)

SUZU/ ★ D15 66964B/37 ★J5 4098-320
Removal of slime from pipe, etc. - using aq. hydrogen peroxide soln. at alkaline pH
SUZUKI Y 21.01.78-JA-005610
C03 E36 Q78 (03.08.79) A01n-09 C02b-05/02 F28g-09

Method comprises introducing aq. H_2O_2 soln. of pH $\geqslant 7$ in the pipe or/and the appts., in which slime, etc. are formed.

Typically aq. 1-2% H_2O_2 soln. is adjusted to pH 7.5-10.0 with alkali e.g. NaOH, Na_2CO_3, NH_3, $NaHCO_3$.

Under alkaline conditions the generation of nascent oxygen from aq. H_2O_2 soln. is greatly accelerated. More nascent oxygen can be generated from the H_2O_2 having lower concn. and slime, etc. can be easily removed inexpensively in a shorter time. It is considered that the alkali not only promotes the generation of nascent oxygen but also is effective for oxfoliation and dissolution of slime, etc. 29.1.78 as 005610(5pp5)

MITQ ★ D15 67076B/37 ★J5 4099-078
Sludge dewatering appts. - in which cracks are formed on sludge surface to improve dewatering tank cleaning frequency
MITSUBISHI ELECTRIC CORP 23.01.78-JA-006330
(04.08.79) B01d-29/04 C02c-03

Water on a sludge in a dewatering tank is introduced into a vaccum chamber by a vacuum pump. When the water on the sludge is removed, a valve is opened to supply water by spraying with nozzles onto the surface of the sludge to form concave grooves in it at a regular distribution.

When the air on the sludge is introduced in the vacuum chamber by the vacuum pump, cracks are generated in the grooves, so that the air is equally passed through the whole sludge to de water the whole sludge equally and effectively. A great number of cracks are formed on the sludge surface to improve dewatering effects and to decrease cleaning of the dewatering tank. 23.1.78 as 006330(4pp35)

ASAH ★ D15 67079B/37 ★J5 4099-082
Sepn. of oil and water from mixt. - by selective permeation of water only through porous resin membrane
ASAHI CHEMICAL IND KK 10.01.78-JA-000864
A88 J01 (04.08.79) B01d-13

Oil and water are sepd. from a mixt. (I) by selective permeation of water only through porous membrane (II), having pores of 0.005-5 u dia. and being made from a resin (III) of critical surface tension $\geqslant$ 35 dyn/cm. The mixt. is composed of X pts. wt. of oil and Y pts. wt. of cpd. other than oil, where Z mol/l of surfactant is contained in Y and $Z \geqslant 0$, when $0.02 \leqq A < 0.5$ and $Z \geqslant 1.78 \times 10^{-3}A - 8.9 \times 10^{-4}$, when $0.5 \leqq A \leqq 0.8$. $A = X/(X+Y)$.

Water and oil-immiscible solvent can be sepd. from oil perfectly.

Polyvinyl alcohol, polyvinyl chloride, polyvinylidene chloride, polyethyl terephthalate, nylon-6, nylon-66, etc. are used for the resin. The number of pores in (II) are pref. 10^7 - 10^8/cm. (I) is pref. an O/W type emulsion and the mean dia. of oil droplets in (I) is 0.1-50 μm. 10.1.78 as 000864(7pp42)

(04.08.79) B01d-13 C02c-05/02

Method comprising (1) sepn. of precipitate contg. Al^{+3} and/or F^- formed by the addn. of alkali cpds. to the water until pH reaches 7-9 and (2) sepn. of precipitate contg. Ca^{+2} formed by the addn. of alkali cpds. and carbonate to (I) until pH reaches 9-11.

The treatment is applied to reverse osmosis treatment of water, exhausted from thermoelectric power plant. 23.1.78 as 006023 (2pp42)

TOKA- ★ D15 67140B/37 ★ J5 4099-343
Oxidn. of sodium sulphide-contg. alkaline soln. - e.g. discharged from recovery system of kraft pulp mill, by contacting with oxygen-contg. gas in presence of chelating forming complex
TOKAI PULP KK (JAPC) 21.01.78-JA-004808
E34 F09 (06.08.79) B01d-53/34 C02c-05/04

Na sulphide-contg. alkaline soln. is contacted with a molecular oxygen-contg. gas, e.g., air, etc., in the presence of 0.0001-0.01 mol/l of an anthraquinone sulphonate, e.g., the Na salts of 2.7- or 2.6-anthraquinone disulphonic acid and of beta-anthraquinone monosulphonic acid, and 0.1-100 ppm of a metal cpd. capable of forming chelate cpd. with the anthraquinone sulphonates, e.g., the sulphates, nitrates, oxy acid salts, and complexes of Fe, Mn, Ni, Cr, Co, V, and Cu at 30-200°C and pH $\geqslant$ 10.

The method is capable of effectively and rapidly oxidising sodium sulphide present in an alkaline soln. into a stable, harmless cpd., Na (thio)sulphate on an economic scale by using smaller amts. of oxygen and any type of operation systems. 21.1.78 as 004808(5pp117)

JAGA ★ D15 67141B/37 ★ J5 4099-344
Treating waste water, e.g. sewage or industrial effluent - by ozonisation followed by treatment with activated carbon
JGC CORP 20.01.78-JA-004853
(06.08.79) C02c-05

Waste water is subjected to oxidn. treatment in an ozone treatment appts. The ozonised waste water is introduced into an activated carbon adsorber to which ozone discharged from the ozonisation tank is supplied.

The deactivated adsorption capability of activated carbon due to adsorption of organic material is revitalised by ozone contg. pure oxygen is supplied to the activated carbon adsorber and thus aerobic microorganisms kept oxidise the organics adsorbed in the activated C. 20.1.78 as 004853 (3pp117)

TOKE ★ D15 67142B/37 ★ J5 4099-345
Reducing ozone requirement for decolourising waste sewage water - by first oxidising nitrite cpds. to nitrate cpds. with hypochlorite, hydrogen peroxide or chlorine
TOKYO SHIBAURA ELEC LTD 23.01.78-JA-005285
(06.08.79) C02c-01/40 C02c-05/04

The ozone-treatment of treated waste sewage water to effect deoolouration is preceded by an oxidn. process in which NO_2^- ion present in the treated water is oxidised into NO_3^- ion by injecting hypochlorite, hydrogen peroxide, or chlorine gas.

The amt. of ozone required to decolourise the water is thereby decreased, allowing costs of the overall process to be reduced. 23.1.78 as 005285(4pp117)

ASAH- ★ D15 67143B/37 ★ J5 4099-346
Treatment of rice washing waste water from breweries - by adding acid to remove starch, sepg. solids by sedimentation, activated sludge treatment, neutralising, etc.
ASAHI CARBON KK 20.01.78-JA-005637
(D16) (06.08.79) C02c-01/06 C02c-05/10 C12g-03/02

In a treatment for purifying rice-washing waste water discharged from brewery factory by using activated sludge, pH of waste water is first regulated to 3-5 by the addn. of an acid, e.g. HCL, H_2SO_4, etc., to coagulate and ppte. starchy substance particles suspended. The sediments a are sepd. after standing for 1-2 hrs in a sedimentation basin, the supernatant liquor is subjected, after neutralisation, to an acitvated sludge treatment and also the sepd. sludge contg. starchy substance particles is neutralised with an alkali aq. soln. and mixed with an aq. soln. of urea or $(NH_4)_3SO_4$ and acid potassium phosphate. The sludge so treated is introduced into an anaerobic fermentation tank to further decompose it by the addn. of an alkaline agent, and the treated water from the anaerobic fermentat-ion tank is passed into the aeration tank during the period March to October for keeping the activity of sludge bacteria.

The capacity of activated sludge aeration tank is reduced to 1/3, and also the treatment facilities can be worked uniformly all the year. 20.1.78 as 005637(6pp117)

SUID- ★ D15 67144B/37 ★ J5 4099-349
Removing arsenic from water - using filter sand which has been treated with ferric chloride soln. and mixed with soda ash and then heat-treating
SUIDDKIKO KK 26.12.77-JA-155659
E36 (06.08.79) B01d-15 C02b-01/14 C02c-05/02

The removal of arsenic from water, e.g. deep well water, copper mining water, etc. by filtration is described. Filter sand particles, for example, are soaked in a 42 Baume ° ferric chloride soln. The filter sand ferric chloride soln. is then mixed with powdered soda ash to pH 8 to form ferric hydroxide on the surfaces of the filter sand particles. The filter sand particles are sepd. and then heat treated at 300-400°C for one hr., and then packed into an approx. 125 cm dia. filter tank to a height of 100 cm. Through this layer the water contg. As is passed to remove arsenic by adsorption using an iron catalyst film formed on the filter sand particles. The filter sand particles are regenerated using an alkaline soln.

This method effectively removes the aresenic using smaller treatment facilities. 26.12.77 as 155659(2pp117)

KUBI ★ D15 67145B/37 ★ J5 4099-352
Denitrification of nitrogen cpds.-contg. liquor e.g. sewage - by mixing with activated sludge, then passing treated liquor to oxygen-rich and oxygen-lean zones to effect removal of nitrogen cpds.
KUBOTA KK 20.01.78-JA-005516
(06.08.79) C02c-01/06

The liquor is mixed with activated sludge to form a treating liquor, and then the treating liquor is circulated in a vertical long circulating flow path consisting of an oxygen-rich first zone, or an ascending flow path, and an oxygen-lean second zone, or a descending flow path, where oxygen is supplied until the supersaturation of oxygen is reached at more than atmospheric pressure from the lower part of the ascending flow path and also bubbles are removed at the upper part of the circulating flow path.

The method is capable of effectively and economically removing nitrogenous cpds. etc. from liquor, e.g. various waste waters contg. nitrogenous cpds., with greater treating capacity and also with smaller floor-spaced treatment facility. 20.1.78 as 005516(2pp117)

HARA/ ★ D15 67197B/37 ★ J5 4099-776
Continuous sludge dewatering appts. - includes layer of sawdust above suction plate, sludge being accumulated on the sawdust and then discharged
HARA M 23.01.78-JA-006603
(06.08.79) B01d-29/04 C02c-03

The dewatering section comprises a vacuum tank, a punched plate, an endless filter cloth and a dewatering tank. A border wall is mounted in the dewatering tank to divide the tank into double inner and outer tanks. A sawdust layer is pre-accumulated in the inside of the border wall and sludge is supplied through an inlet into the inner tank. The filter cloth and the punched plate are contacted with the bottom of the dewatering tank to hold rubber seal members on the lower edges thereof.

A sludge layer is gradually accumulated on the sawdust layer by sucking and filtering the sludge water. The sludge water is leaked through between the seal member and the cloth to form a sludge layer in the lower end of the inner periphery of the border wall so as to compensate the sealing function. The sludge dewatered in the dewatering section is discharged from a shoot.

The dewatering tank has a double construction to improve the sealing ability because it is sealed with the water in the outer tank if the rubber seal is deteriorated. 23.1.78 as 006603(6pp35)

EBAI ★ D15 67202B/37 ★ J5 4099-783
Regenerating permeable membrane for protein sepn. waste - by immersing in fresh water in static or fluidised condition
EBARA INFILCO KK 24.01.78-JA-006466
J01 (D17) (06.08.79) B01d-13

Waste soln. exhausted in the seon. of proteins is permeated through a permeable membrane to recover useful components. Membrane is then regenerated by immersing in fresh-water in a static or fluidised condition for $\geq$ 7 hrs. to regenerate it. Contact of the membrane with fresh-water is opt. carried out after washing it with alkali, and the fresh-water opt. contains a bactericide fungicide or a non-freezing agent.

In an example, a decanta sepd. soln. by-produced in prodn. of starch was passed through a reversedly permeable membrane under a pressure of 50 kgf/cm^2 at 25°C to recover useful components. The used membrane was contacted with fresh-water under a pressure of 0.2 kgf/cm^2 at velocity 20 cm/s of the surface of the membrane, and regenerated. The permeable ability of the membrane was regenerated to $\geq$75%. 24.1.78 as 006466(3pp51)

Polyvinyl alcohol sepn. from aq. solns. - by adding boric acid soln. and alkaline earth metal hydroxide
HOECHST AG 07.01.77-DT-700361
*A35 (A14) (28.08.79) *BE-862-753 C02b-01/18 C02c-05/02*

PVA is sepd. from waste water by adjusting the pH to $>$ 11 by the addn. of $Ca(OH)_2$; pptg. a PVA/boric acid/didiol complex from the waste water by adding aq. boric acid which has been pre-neutralised with CaOH; and sepg. the complex from the water.

Pref. a satd. soln. of $Ca(OH)_2$ is used. Pptes. formed settle very rapidly and can be sepd. by filtration or decantation.

PVA can be recovered from the complex by dissolving the ppte. in hydrochloric or nitric acid, enabling solns. of high concn. to be obtd. from highly dil. PVA solns. 5.1.78 as 867141(4pp931)

ENVI- ★ D15 67868B/37 ★US 4166-036
Floating skimmer for removal of contaminants - produced during water purification with angled blades for concentrating contaminants
ENVIRONMENTAL ELEME 13.08.75-US-604432
Q42 (28.08.79) E02b-15/04

A skimmer moves along the length of a rectangular liq. treating tank. The skimmer extends across the width of the tank and is formed of two series of blades, each series formed of a set of oppositely angled inter-connected blades. The first and second series of blades are oppositely angled and are connected where they contact each other to form vertexes for collecting floating contaminant particles.

Floats are connected to the skimmer to maintain a portion of it above the liq. surface. A vacuum is applied to the skimmer near the vertexes to remove the collected contaminants.

The appts. is used to remove floating contaminants produced during water purification. The skimmer is operable regardless of the liq. level in the tank. 13.8.75 as 604432(10pp295)

PICA- D15 77595X/42 =US 4166-037
Carbon filter to replace sand in treating polluted water - layers of carbons of different absorption characteristics
SOC PICA 30.05.75-FR-016931
*J01 (28.08.79) *BE-842-215 +B01d-23/14*

An adsorption filter for purifying water comprises a housing having a filter media; a water inlet; and an outlet for purified water and through which backwashing liq. is applied. The filter material consists of grannular layers of different types of activated carbon which are directly juxtaposed. All of the carbon of one layer has the same mesh size, apparent density and adsorptive capacity.

The material of each layer, proceeding from the inlet to the outlet have decreasing internal pore size and increasing indices of retentivity to retain, by adsorption, dissolved impurities of successively smaller molecular dimensions.

This premits a layer of material more closely adjacent to the filter outlet to retain more fugacious light dissolved impurities not retained or released by desorption by the material of a layer lying more closely adjacent the filter inlet. Only a thin layer of expensive active carbon need be used. 26.5.76 as 690269(26.5.76-US-690169)(4pp976)

Compsns. for inhibiting magnesium scale in evaporative desalination - contg. polycationic and polyanionic polymers
AMERICAN CYANAMID CO 15.12.77-US-860914
A97 (A14) (28.08.79) C02b-05/06

Compsn. for inhibiting the formation of Mg salts or sludge in evaporative desalination units consists of: (a) a polyanionic polymer (I); and (b) a polycationic polymer (II). (I) has mol. wt. 500-50000; and contains $\geq$50 mol. % of repeating units derived from an ethylenically unsatd. dibasic or sulphonic acid (acid units as free acid; or NH_4 or alkali metal salt) with the balance of repeating units derived from $\geq$1 compatible monomers (III).

(II) has mol. wt. 1500-500000; and may be (a) an $HNMe_2$-polyamine-epichlorohydrin reaction prod. (amt. of polyamine 0-15 mol. % of total amine content; amt. of epichlorohydrin is $\nless$ mol. equiv. of total amine content to full functional equiv. of the total amine content), (b) poly(dimethyldiallylammonium chloride), (c) quat. derivs. of poly(dimethylaminoethylmethacrylate), and (d) poly(oxyethylene(dimethylimino)ethylene(dimethylimino)ethylene)dichloride. Mol. ratio (II):(I) (based on av. mol. wt. of repeating units) is 1.5-25:1.

Compsn. effectively inhibits the formation of Mg scale or sludge in evaporative desalination units, and allows the units to be operated for greatly extended periods of time at high efficiency. The compsn. is also effective against $CaCO_3$ scaling, and thus protects against scale formation at a wide range of temps. 15.12.77 as 860914(5pp478)

Aerobic treatment of waste water by activated sludge - has intermediate flocculation and filtration zone between aeration and settlement
ADWATRE INC (OTTK/) 18.02.78-CH-001790
*(06.09.79) *NL7901-261 C02c-01/06*
D/S: N(BR, DT, DK, GB, JA, SW, SU, US).

Waste water is biologically purified in an aerobic basin with an aeration zone and a settlement zone, the two zones being separated by an immersed vertical wall which permits the passage of water and suspended matter across its upper edge from the aeration zone to the neighbouring zone and of sludge beneath the lower edge back into bottom f the aeration zone.

The treatment basin is equipped with an intermediate one (33) between the aeration zone and the settlement zone hich serves as a flocculation and filtration bed. The ntermediate zone (33) is formed by the immersed vertical artition (14), the inclined floor of the basin and an ssitional inclined wall (34) with a cap (31) along its outer, ower edge through which the pptd. solids can fall back nto the intermediate zone (33). The geometry of the intermediate zone is such that the communication gap between ettlement zone and the intermediate zone is at approximately half the height of the latter zone (33) and coincides vith the level at which the water flow is at a minimum and s consequently laminar.

The use of the intermediate zone enables a satisfactory circulation of activated sludge to be attained without hydraulic disturbance of the settlement zone so that the clarification is maximised. The clarification is further assisted by the laminar flow zone which also serves as a filtration zone due to the presence of the coagulating particles.

Peptidoglycan extracts of bacteria, esp. Bacillus species - stimulating antitumour immunity

INST NAT SANTE RECH MED 30.11.77-FR-036196

B04 (03.08.79) A61k-35/74

Use of peptidoglycans (I) in the form of natural, insoluble extracts of bacteria, esp. of the genus Bacillus, as pharmaceuticals is new. Pref. the bacteria used are B. megaterium (ATCC 14581), B. licheniformis (ATCC 994 and Corynebacterium poinsettiae (NCPPB 846). Pref. compsns are aq. suspensions, opt. contg. an antiseptic, formulated for admin. by injection.

(I) are useful as a complement to other anticancer tre tments to prevent metastatics and relapses. They can be administered at about 1mg/10 kg 1-2 times per week. Their side effects (if any) are less severe than those of C. parvum extracts. 30. 11. 77 as 036196 (24pp1251)

Automatic periodic sampling and analysis of beer durin fermentation - for improved quality control of large sca automated brewing

KRONENBOURG BRASSER 02.12.77-FR-036953

A88 J04 R16 (03.08.79) B01d-15/08 C12l-07 G01n-01/10 G01 33/14

The sample is automatically prepd. and analysed to determine the proportion of volatiles. Each of several sampling circuits in turn is switched through a three-wa valve with rinsing branch and single delivery to the coil of a temp. regulating bath. The sample is then piped tangentially into the base of a sample prepn. vessel. The vessel. The vessel has an inlet for injection of pressurised, inert gas and an outlet leading to a gaseous phase chromoatograph analyser. The installation is automatically sequenced by a process control programme unit. Circuit rinsing is automatic between sampling operations.

The sample prepn. vessel pref. has a gas inlet diffus near the base of the vessel, as well as a liq. level detect controlling the level via signals to the programme unit. The carrier gas is pref. carbon dioxide. The temp. regulating bath is pref. fitted with both refrigerating and heating elements.

Used for automatic, regular sampling of beer during the course of fermentation followed by precise, gaseous phase chromatographic determin. of proportion of volatiles. The prods. provides the frequent, e. g. 4-hourly, monitoring of fermentation necessary to assure reliable quality control of automated brewing operations. A single analyser efficiently serves several fermentation tanks partic. three or four outdoor tanks each with a capacity of several million litres. 2. 12. 77 as 036953 (14pp448)

Prodn. of acetone and butanol from cellulose - by single sta saccharification and fermentation process

BIO RES CENT CO LTD 28.04.77-JA-049401

*E17 F09 (12.09.79) *BE-863-677 C12d-03/02*

Acetone and butanol are produced from cellulosic materi (I) by reacting (I) simultaneously with a cellulase and a acetone-butanol producing microorganism (II) thus saccharifying and fermenting (I) to give the desired prods. .

The cellulase may be a culture of Trichoderma Viride or it may be a commercially available prod., esp. Cellulase Onozuka, (II) is pref. Clostridium acetobutylicum or C. saccharoacetohutylicum. Reaction is pref. effecte at 30-55°C at pH 4-6.

A wide variety of waste materials e.g. wood, rice straw, husks, corn stalks or cobs, paper and cardboard waste etc. can thus be utilised. Process is simplified a inhibition of the cellulase and (II) by glucose is reduced, thus giving increased yields. 21. 12. 77 as 053337 (3pp).

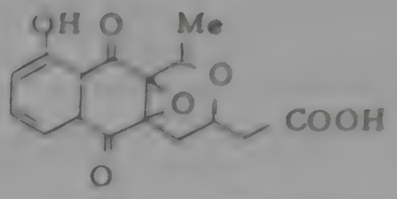
B02 (12.09.79) A61k-31/35 C07d-311/92 C07d-493/08

Nanaomycin E of formula (I) and its salts are new:

(I) is active against Gram-positive bacteria, Trichophyton and Mycoplasma, and is useful for treating appropriate conditions in man and animals. It is an intermediate for the prepn. of nanomycin A as described G.B. 2015526. (I) has LD_{50} 60 mg./kg. intr ously in mice.



(I)

6.3.79 as 007886 (10pp1248).

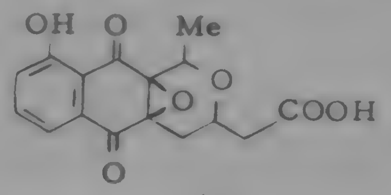
KYOW ★ D16 66680B/37 ★GB 201

Prepn. of antimicrobial nanaomycin A in high yield - by red nanaomycin E esp. in unpurified fermentation media

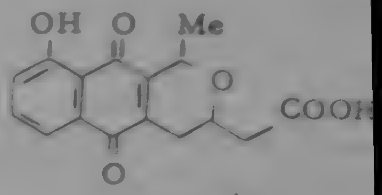
KYOWA HAKKO KOGYO 07.03.78-JA-025042

B02 (12.09.79) C07d-311/92

Prepn. of nanomycin A of formula (I) comprises reduc nanomycin E of formula (II).



(II)



(I)

(I) is obtd. in relatively high yield. (I) is active agai Gram-positive bacteria, Trichophyton and Mycoplasma, and is useful for treating appropriate conditions in man and animals; it has high activity, good stability and low toxicity. 6.3.79 as 007887 (12pp1248).

BAXT ★ D16 66705B/37 ★GB 2015-7

Testing liquid sterility for bacteria and mould - by dividing samp flow into separate filtered growth chambers

BAXTER TRAVENOL LAB 13.03.78-US-885747

R16 (12.09.79) C12k-01/06 G01n-15/06

A liq. sample flows down a conduit toa Y-connector whic divides the flow into two sub-streams. Each sub-stream flows to a separate chamber with an air vent which allow the sample liq. to flow into each chamber. A filter is located at the lower end of each chamber above a vacuum manifold to draw the sample through the filter.

A different growth medium is then introduced into eac chamber via an injection site at the top of each chamber. Pref. each test chamber is constructed of PVC with a wal thickness > 0.020 in. to prevent oxygen diffusion into the chamber. Pref. each filter has a pore size of 0.45 μ.

A sample is divided into two sub-streams which are se arately filtered and incubated after the introduction of growth media to detect respectively the presence of bacteria or mould in the sample. The appts. avoids the handling step of a previous method in which the sample is retained on a single filter which is then cut in two prior to incubation. 12.3.79 as 008659 (8pp295).

HASE ★ D16 66740B/37 ★J5 4096-53

Chromogenic prods. of gardenia fruit dye - are obtd. usin Hansenula Saccharomyces or monascus strain

HASEGAWA KK 17.01.78-JA-002648

E24 (31.07.79) C09b-61

Yellow gardenia fruit dye is contacted with a chromogenic prod. formed by a chromogenic strain selected from Hansenula, Saccharomyces and Monascus and capable to convert the gardenia dye from yellow to yellowish green or blue at a pH of 3-10 at 10-60°C toform dye for dyeing food drinks, medicals, perfumes and cosmetics.

In an example, 20g corn starch, 1.5 g ammonium nitrate, 1.0 g of corn steep liquor, 0.6 g dihydrogen phosphate, 4.0 g of disodium hydrogen phosphate and 0.5 g $MgSO_4$ were dissolved in 1 l of deionised water, to which 100 ml of gardenia fruit extract having absorbance of 1400/ml at 440 mμ. The pH of the culture medium was adjusted to 6 and sterilised at 120°C for 15 min. by means of a shaking machine. The culture medium was seeded with 2 Pt loops of Hansenula anomala OUT 6816 cultured on yeast slant for 3 days and then cultured at 30°C for 3 days under shaking. The cultured mixt. was sterilised at 85°C for 30 min. and filtered through diatomaceous earth to obtain gre en filtrate having absorbance of 103 at 440 mμ and 71 at 595 mμ.

Process provides yellowish green or blue and water-sol. es having resistance to light and heat. 17.1.78 as 02648(8pp)

Antitumoural straight chain mannan cpds. - obtd. by culturing yeast of Saccharomyces strain
GRELAN PHARMACEUTICAL KK 20.01.78-JA-004214
B04 (01.08.79) A61k-31/71 C08b-37 C12d-09/04

Straight chain mannans of a mol.wt. > 10000 are obtd. by culturing strain of yeast belonging to Saccharomyces, extracting the mannas from the yeast plant, and purifying.

The prods. do not contain N and P and have an angle of rotation of 60-65° (in water). The yeast is cultured generally with shaking or stirring and ventilation. The culture is carried out at 25-45°C for 24-200 hrs. For the culture, liq. culture medium is pref. used. As source of carbon, glycose, starch, citric acid, glycerine, etc. are used and source of N, casein, peptone, bean powder, ammonium sulphate etc. are used. 20.1.78 as 004214(7pp136)

GREC ★ D16 66962B/37 ★J5 4098-306
Cholinesterase prodn. from human blood plasma - by selective pptn. and extn., using polyethylene glycol, anion exchange resin, ammonium sulphate, and sodium sulphate
GREEN CROSS CORP 23.01.78-JA-005302
A96 B04 (A25) (03.08.79) A61k-35/16 A61k-37/54

Method comprises performing the following steps (a), (b) and (c) in desired order. Step (a) comprises adding polyethylene glycol to aq. medium (protein content 0.5-5% w/v) of human blood plasma or blood plasma protein contg. fraction, including cholinesterase at pH 3-7 to give 3-5% w/v polyethylene glycol concn., removing the ppte., adding polyethylene glycol to the supernatant to give 5-25% w/v polyethylene glycol concn., and recovering the resulting ppte.

Step (b) comprises contacting human blood plasma or blood plasma protein contg. fraction, including cholinesterase with anion exchange resin at pH 4-6, at low base concn., and eluting with aq. soln. of base, at pH 4-10. Step (c) comprises removing a ppte formed by adding an amt., corresp. to 30-40% saturation, of $(NH_4)_2SO_4$ and an amt., corresp. to 3-10% w/v concn., of Na_2SO_4, to aq. medium of human blood plasma or blood plasma protein contg. fraction, including cholinesterase, at pH 4-10, from the aq. medium and recovering a ppte. formed by adding an amt., corresp. to 30-60 saturation, of $(NH_4)_2SO_4$ and an amt., corresp. to 10-20% w/v concn., of Na_2SO_4 to the blood serum.

High purity cholinesterase is produced. It is useful for treatment of toxicosis, caused by organic phosphorus, and of difficulty in breathing, caused by over-dosing of succinyl choline chloride in surgical operations. 23.1.78 as 005302 (7pp68)

BIOR- ★ D16 66981B/37 ★J5 4098-389
Preparing yeast body from cellulose material - by adding cellulase and yeast to a culture medium contg. cellulose as carbon source, and culturing the yeast
BIO-RES CENT KK 19.01.78-JA-004527
(03.08.79) C12b-01 C12c-11/08

Commercial cellulase, the enzymic extract of Trichoderma viride, its cultured liq., etc. can be used. Examples of applicable yeast strains are Candida utilis, C.tropicalis, Saccharomyces cerevisiae, S.carbobergens, Mycotorula japonica, etc. Practically the liq. culture medium contg. cellulose 1-50 w/w% nitrogen source, inorganic salts and nutrients, is sterilised and after adding cellulase and seed yeast, the culture is practiced at 25-45°C at pH 3-7 for 1-4 days.

Yeast body can be prepared with high yield from cellulose materials in a single process. As the cellulose material not only refined cellulose, but also various cellulose-contg. agricultural prods. and various cellulose-cotg. waste materials and the method is valuable from the view point of utilisation of resources. 19.1.78 as 004527 (4pp5)

MITC ★ D16 66982B/37 ★J5 4098-391
Plant callus growth - by culturing in presence of 3-isopropyl phenoxyacetic acid which has auxin properties
MITSUI PETROCHEM IND KK 20.01.78-JA-004221
E14 (03.08.79) C12k-09

Method is characterised by carrying out the culture in the presence of 3-isopropylphenoxyacetic acid (I). (I) had auxin properties.

Pref. (I) is combined in an amt. of 10^{-4}-10^{-6} mol/l in known culture medium for tissue culture and callus is laid and cultured in the culture medium. Using tobacco callus (I) shows similar or superior auxin activity c.f. indolacetic acid and with (I) good white callus can be obtd. 20.1.78 as 004221(3pp5)

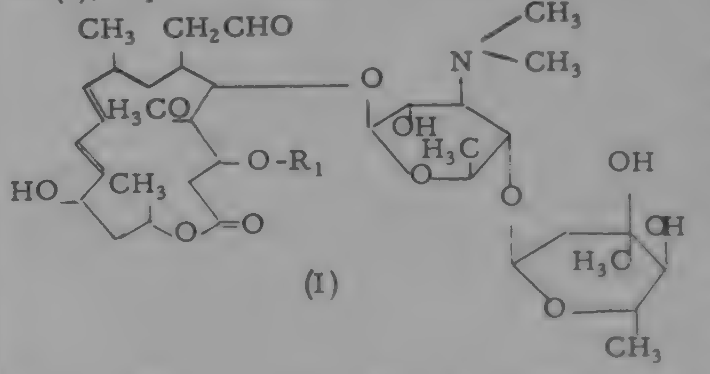
B04 (03.08.79) A61k-35/84 C12d-13

Thielavin A and Thielavin B are new. They are prepd. by culturing fungi of the Thielavia genus and have prostaglandin bioxynthesis-inhibiting action and antiinflammatory action.

Pref. fungi strain is e.g. Thielavia terricola SANK 10475 strain (FERM p-4341). The cpds. may be administered in form of capsules or tablets or by injection. 17.1.78 as 003454(8pp69)

TOXN ★ D16 67033B/37 ★J5 4098-793
Deacylated antibiotics - used in mfr. of 13-acylated cpds. having antimicrobial activity
TOYO BREWING KK 27.01.77-JA-008078
B03 (03.08.79) C07h-17/08 C12d-09 C12d-13

Deacylated antibiotics of formula (I), or salts, are new. In (I), R_1 = H , acetyl or propionyl.



(I)

(I) only possess low antimicrobial activity, but give 13-acyl antibiotics exhibiting fairly good antimicrobial spectra and blood concns. by acylating the 13-hydroxy gp. and then acylating the 4''-hydroxy gp.

Prepn. comprises reacting an antibiotic of formula (I) where the 4''-OH gp. is a gp. $-OR_2$ (in which R_2 is acetyl, propionyl, butynyl or isovaleryl) with an esterase which specifically splits the ester bonded to the 4''-position. The reaction is pref. in the presence of a culture or a treated culture of microorganism capable of producing the esterase. The esterase-producing microorganism includes those belonging to Genus Nocardia or Staphylotrichum (e.

g. Nocardia sp. FERM-P 2019, Nocardia corallina IFO 3338, Nocardia gardneri IFO 3385, Staphylotrichum cocco-sporum FERM-P 2280, etc.). The antibiotic (II) is prepd by allyl rearrangement of a known antibiotic, e.g. leucomycin A_1, A_5, A_7 and A_9, YL-704A_3, etc.) 27.1.77 as 008078 (9pp140)

_B02 (B05) (21.08.79) *J51151-318 +C12d-13_

The yeast is dispersed in hot water at 80-85°C for 5-10 mins. and then cooled rapidly. Removal of the organism yields the hot water extract contg. glutathione, NAD and NADP. The extract is mixed with Cu_2O under H_2SO_4 conditions to give ppte. of glutathione, which is recovered and subjected to Cu-elimination procedure to yield glutathione crystals. The supernatant soln. is passed through a column of strongly acidic cation exchange resin equilibrated with HCl under acidic conditions at pH 1. NAD and NADP are absorbed. The Cu ions are eluted with 0.1-0.5 N HCl, and NAD and NADP are eluted with an acid or alkali such as AcOH or AcONa.

When the supernatant soln. is passed through the column at pH 1, the Cu ions are insufficiently sepd. from NAD and NADP. The resulting NAD and NADP contain very little Cu ion, which may be purified using a combination of slightly basic anion exchange resin and strongly acidic cation exchange resin.

The yeast is bread yeast, beer yeast, yeast of pulp waste water, petroleum yeast etc. 19.6.75 as 073764 C12d-13/00 (21.8.79) ORIENTAL YEAST IND (3pp) (J51151318)

Effervescent liquid sampling process - extracts from three levels into piping system filled with water, used esp. for beer during fermentation

TEPRAL (ECON-) 02.02.77-FR-004025
*R16 (28.08.79) *DT2758-061 G01n-01/16*

Beer fermentation prods., stored in a fermentation tank, are sampled and measured by using a main sampling conduit with branch conduits, each connected to the tank at different vertical points. The main sampling conduit is initially charged with water and a sample of beer is withdrawn through one sampling conduit at a time into the main conduit while maintaining the other conduits isolated from the main conduit. The sample is carried by the water to a measuring station.

The process used only a min. amt. of beer, avoids the rmation of foam and is fully automatic. The beer sample an be recycled. The sampling frequency can be adjusted a function of the fermentation advance. 22. 9. 77 as 35787 (7pp976)

Yeast prod. of uniform bland flavour - is prepd. by treating fresh yeast with oxygen at elevated temp.
STANDARD OIL CO (IND) 22.08.77-US-826858
(28.08.79) C12c-11/26

The colour and flavour of a yeast prod. is improved by oxygenating a slurry contg. 10-20 wt.% fresh yeast cells using a gas having an oxygen partial pressure of 0. 5-20 atmospheres, for 1-15 mins. at 80-100°C and pH 4-7.

The gas is e.g. air, enriched air, or pure oxygen, and the oxygen partial press. is 0. 5-2. 0 atmos. The pH of the treated slurry is pref. raised to 6. 8-7. 0, and the slurry is then spray-dried. The yeast is pref. candida utilis.

The prod. has a reproducible bland taste, with a slight sweet, mushroom and almond flavour and cocoa aroma. 22. 8. 77 as 826858(4pp955)

SLIT ★ D16 67917B/37 ★US 4166-141
Stabilisation of malt beverages - by passage over a fluidised bed of adsorbent particles
SCHLITZ J BREWING CO 15.08.77-US-824393
A97 (A14) (28.08.79) C12h-01/04

Malt beverages are stabilised as follows; (a) the beverage is passed upwards through a bed of adsorbent particles (I) of polyvinylpyrrolidone or silica gel at such a rate that the bed is fluidised and the haze forming substances (II) are adsorbed onto (I); (b) (I) are continuously removed from the upper portion of the fluidised bed and are treated with a material (III) capable of solubilising the adsorbed (II); (c) the regenerated (I) are continuously returned to the lower portion of the bed.

The (I) bed is contained in a vessel which has an upper portion with a larger cross sectional area than the lower portion, and the beverage is kept at a higher mass velocity in the lower portion than in the upper part.

Use of the fluidised bed gives increased adsorption efficiency and a more uniform and consistent treatment, and allows the regeneration and re-use of the relatively expensive adsorbent. 15.8.77 as 824393(4pp478)

Apparatus for continuous cell culture - has filter mounted on rotating shaft supported in stationary sleeve
MONSANTO CO 14.11.77-US-850987
(04.09.79) C12k-01/10

Appts. for the continuous suspension culturing of cells includes a hollow flask having a top opening. An elongate hollow shaft and stationary sleeve assembly are positioned within the flask, the shaft being journalled for axial rotation in the sleeve assembly. The shaft is in fluid communication with the top opening and is supported downwardly with no lower bearing.

A filter is supported downwardly from the shaft without any lower bearing or moving seals between the filter unit and any filter support which could contact the cell suspension. The filter rotates with the shaft. The filter has a cavity communicating with the interior of the shaft, and a porous peripheral surface having a pore size smaller than the cells to be cultured or the carrier particles upon which the cells are attached. The pores however are sufficiently large to permit permeation of the fluid into the cavity.

Appts. can be used for suspension culturing of mammalian cells. Fresh medium can be added and spent medium sepd. from the growing cells by filtration on a (semi)-continuous basis. 14.11.77 as 850987. (7pp295)

Loading device for shaft furnace - has receiving funnel with annular chamber round it connected to outgoing gas pipeline, used in soda, sugar etc. prodn.
CEMENT AUTOCLAVE 04.01.77-SU-440423
E34 J09 Q77 (10.12.78) F27b-01/20

The mechanism comprises a receiving funnel, two-valve lock, inter-valve tube and outgoing gas pipeline.

For a better seal, it has an annular chamber round the receiving funnel, connected to the outgoing gas pipeline and the receiving funnel is made with slits connecting it to the cavity of the annula chamber.

In operation, the departing gases are sucked by the smoke suction system and ejected to atmosphere along the pipeline. Some of the furnace gases go into the annulare chamber and through the slits into the receiving bunker. This forms a gas curtain preventing penetration of atmospheric air into the shaft so that the concn. of furnace gases can be increased.

Colloids content in sugar-contg. juices and molasses in sugar factories, is determined by mixing a soln. sample with an agent effecting precipitation of the colloids, sepg. the ppte., drying and weighting.

The process is accelerated and its accuracy is improved by using as a colloid-precipitating agent a soln. of a strongly basic anionite derived fron amino ester of methacrylic acid. After the removal of the ppte., the residual content of the anionite in the soln. is determined photometrically. The decrease, compared with the original anionite content, corresponds to the colloids content.

Combination cigarette filter transfer device - with distance lug on leading end of holder for accurate cavity recess
HAUNI-WERKE KORBER KG 03.03.78-DT-809160 (00.00.75-DT-534666)
P15 (06.09.79) A24c-05/50

The Parent Patent described a machine for the mfr. of combination filters for cigarettes which include a cavity recess. The holders of the transfer conveyor which deposit the filter plug gps. one after another in the longitudinal axis are provided at their leading ends with a distance lug, representing a dummy plug, and at their lagging end with a stop.

This ensures an exact definition of a recess even when the lengths of all other filter components fluctuate. The axial extent of a recess can never drop below a set minimum. 3.3.78 as 809160 Add to 2534666 (11pp39)

Tobacco or food treatment by liquid cryogen - with recovery after treatment of liquid and vapour
TYREE L 24.04.78-US-899410
Q75 (D14) (28.08.79) F25d-17/02

A prod. is treated by immersion in a liq. cryogen at near equilibrium conditions. A processing chamber is loaded with the prod. and purged by cryogen vapour at superatmospheric pressure. The liq. cryogen is then transferred to the processing chamber from a holding chamber by a compressor which returns the liq. to the holding chamber after prod. treatment.

Vapour remaining in the processing chamber is removed by sequentially connecting the processing chamber to a set of three receivers maintained at different pressures. The holding chamber is automatically supplied with make-up cryogen to compensate for cryogen consumed during prod. treatment.

Tobacco leaves are exposed to the cryogenic liq., e.g. CO_2, which fills the prod. pores. Subsequently the cryog-

n expands to stretch the pores and physically expands the
rod. The cryogenic liq. is reused and becomes satd. wi-
h substances leached from the tobacco and thus minimis-
s further leaching of tobaccco components. 24.4.78 as

Cosmetic creams and lotion prodn. - to rejuvenate skin and remove wrinkles, contains irradiated base of animal embryos
NAHON M 05.12.77-FR-036603
(03 08 79) A61k-07/48

The active constituent of the prod. are subjected to one or more cycles of treatment. In each cycle the constituents are powerfully homogenised and then held at the cryoscopic temp. of the cells while ensuring that drying of the constituents does not take place.The temp. of the prod. is then raised to ambient at which it is subjected to ultraviolet irradiation.

For irradiation treatment the prod. is pref. spread in a layer about 1mm thick on a flat plate. Irradiation pref takes place for successive short spells interrupted by periods of rest. Homogenisation is pref. effected by vibrations at a frequency of 300-400 cycles per minute for a period of 10-12 minutes. The constituents are pref. filtered through a microporous filter and the filtrate dissolved in a cosmetologic vehicle.

The process provides much more efficient extraction of active constitiuents than previous processes. Rejuvenating properties are accordingly enhanced. 5.12.77 as 036603 (5pp448)

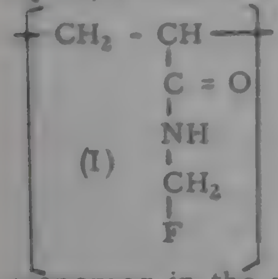
Polymers absorbing ultraviolet radiation - for use in cosmetic compsns. giving protection from the sun
L'OREAL SA 29.07.76-FR-023174 (26.06.73-FR-023254)
*A96 (A14) (28.08.79) *BE-854-748 A61k-07/42*

An anti-solar cosmetic compsn. is prepd. comprising an aq. hydroalcoholic or oily soln. of ≥1 anti-solar polymer having ≥1 unit of the formula (I) in its macromolecular chain.



(I)

$$\left[CH_2 - \underset{\underset{\underset{\underset{F}{|}}{CH_2}}{\underset{|}{\underset{NH}{|}}}}{\underset{|}{\underset{C=O}{|}}}{CH} \right]$$

In the formula, F is a residue derived from an aromatic cpd. imparting to the polymer the ability to absorb wavelengths of 280-315 nm.

The compsn. further contains ≥1 unit derived from an ethylenically unsatd. monomer in the macromolecular chain, present to 20-90 wt.% of the polymer. The polymer has average mol. wt. of 2000-1000000 and is present in amt. of 0.2-20% of the total compsn.

The compsn. prepd. can be applied to the skin to form a film exhibiting good affinity with the epidermis. The compsn. is non-toxic, and can protect dyes present in cosmetic formulations such as hair dyes from degradation. 18.8.76 as 715565 C.i.p. 3980617(+27.6.73-US-374058) (15pp931)

Nail varnish removable by drawing varnish off nail - contains resin soluble in organic solvents and substd. organo-polysiloxane pref. contg. polyoxyalkylene gps.
LION DENTIFRICE KK 02.02.77-JA-009808
*A96 G02 (A14 A25 A26) (28.08.79) *DT2804-298 A61k-07/04*

A nail enamel compsn. is prepd. by dissolving a solid resin and an organopolysiloxane, esp. a copolymer having a polysiloxane structure and a polyalkylene structure, together in an organic solvent.

The compsn. contains 100 pts. wt. of a natural or synthetic resin which is solid at room temp., 0.01-30 wt. pts. of an organopolysiloxane, $R_a{}^1R_b{}^2(SiO)_{4-a-b/2}$, where R^1 is a monovalent hydrocarbon, and R^2 is bonded directly to the silicon atom to form an Si-O-linkage. R^2 is hydroxy, alkoxy, a residue of formula $-OCOR^3$ or a polyoxyalkylene; a and b are positive numbers such that (a+b) is 1-8-3.0. Pref. the resin is a copolymer of vinyl chloride and vinyl acetate, a sulphonamide resin, an acetal resin, a polyacrylic ester, a polymethacrylic ester or nitrocellulose.

The compsn. forms a film on the surface of the fingernail and the film thus formed can easily be peeled off. 31.1.78 as 873850(5pp931)

Dry powder zinc oxide contg. adhesive cement - contg. (non)polymerised carboxylic acid, setting to strong hard product on water wetting, for dentistry
SMITH D F 31.05.77-US-801609 (07.07.75-US-593885)
A96 (04.09.79) C09k-03

An ultra-dry powder mix that on moistening with water quickly becomes adhesive and sets to a strong hard cement is made by (a) mixing ZnO and a weak organic solid acid (I) in an inert volatile anhydrous liquid (II) to thoroughly wet the powder components to form a slurry, (b) evaporating the liq. from the slurry after shaping into a desired form, and (c) protecting the slurry and dried prod. from moisture until use. The ZnO may be essentially pure or treated with 0.5wt.% of propionic or lauric acid. (I) is a solid, non-polymerised polycarboxylic acid or solid polymer acid that is quickly wet and is very soluble in water.

The cement may be used as a base or lining in a tooth cavity, temporary fixing for the bands of ortho-dontic appliances, for sealing root canals, for permanent fillings and in orthopaedics to assist in replacing bone fragments. The cement is partic. adhesive to the skin but is non-irritating. Excess water is not required and strength of the cement is improved. 31.5.77 as 801609, C.i.p.4046578. (6pp966)

Herbicidal and fungicial pyridyl triazinones - e.g. 3-(2-pyridyl)1,4,5,6-tetrahydro-1,2,4 triazin-5-one
SUMITOMO CHEMICAL KK 21.01.75-JA-009543
*C02 E13 (21.08.79) *DT2602-186 A01n-09/22 C07d-401/04*

Agents with herbicidal and fungicidal activity contain a cpd. of formula (I):-

(I) 
(where A is -NH-CHR- or -N=CR-, the N-atom of this residue being attached to the N-atom. adjacent to A in the ring, and R being H, 1-5C alkyl, (1-3C alkoxy) carbonylmethyl, or phenyl), e.g. 3-(2-pyridyl)-1, 4, 5, 6-tetrahydro-1, 2, 4-triazin-5-one. The cpd. (I) in which A is $-NH-CH_3-$ is new and claimed. (I) have herbicidal and fungicidal properties, and are partic. suitable for non-medicinal purposes (e.g. for agricultural or industrial purposes).

(I) are active against a wide range of phytopathogenic fungi and in addn. have considerable antimicrobial activity against various fungi and bacteria occuring in industrial prods. The toxicity of (I) to mammals and fish is low. When used as herbicides, (I) display pre- and post-emergence activity against various grassy and broadleaved weeds. The selectivity of (I) is so high that many crops such as rice, wheat, radishes, soya beans, cotton, beet, maize and rape are not markedly damaged by (I). 21.1.75 as 009543 A01n-9/11;C07d-401/04 (21.8.79) SUMITOMO CHEMICAL KK (5pp)(J51086132)

HESS/ ★ D22 67777B/37 ★SW 7712-360

Regenerated cellulose fibres with high liq. absorbing capacity - mfd. by incorporating alkali metal or ammonium salt of copolymer of an alkyl-vinyl-ether and unsaturated di:carboxylic acid
AKZONA INC 29.11.76-US-745934
*A11 F06 +P32 P34 (28.08.79) *DT2750-900 A61f-13/18*

Fluid absorbent regenerated cellulose fibre is admixed with 2-35 wt.% (based on wt. of cellulose) of a water-sol. alkali metal or ammonium salt of a copolymer of an alkyl vinyl ether and an unsatd. dicarboxylic acid (anhydride), having a mol. wt. of $\geqslant$ 250000. The fibres are more absorbent than non-alloyed cellulosic fibres.

Pref. copolymer is formed of alkyl vinyl ether and ethylenic α, β-dicarboxylic acid (anhydride), specifically maleic acid. Specific copolymer is formed of methyl vinyl ether and maleic anhydride.

The fibres are used in nonwoven absorbent articles, e.g. diapers, tampons, wiping cloths, etc. They have increased absorbency characteristics. 29.11.76 as 745934 (5pp924)

SQUI D22 89644A/50 =US 4166-051
Formable compsn. used as protective layer for stoma in surgery - comprises mineral oil and premix contg. adhesive, gum and/or reinforcing agent
SQUIBB E R & SONS INC 08.06.77-US-804692
*A96 G04 P32 +P34 (A18) (28.08.79) *BE-867-939 A61f-05/44 C08l-03/04 +C08l-01/02*

An ostomy compsn. is prepd., adapted for medicinal use around the stoma comprises a mineral oil and premix in ratio 1-3.3:10 on a solids wt. basis.

The premix is a homogeneous mixt. of (A) 40-60 wt.% of a pressure-sensitive adhesive component and an opt. elastomer, and (B) 40-60 wt.% of a mixt. of $\geqslant$1 hydrocolloid gum and/or cohesive strengthening agent.

The adhesive cpd. is a low mol. wt. polyisobutylene, and the elastomer a medium mol. wt. polyisobutylene or butyl rubber in amt. $\leqslant$ 30 wt.% w.r.t. low mol. wt. cpd. The hydrocolloid gum comprises $\leqslant$ 40 wt.% of guar and/or locust bean gum, and 0-25 wt.% of pectin and/or gum karaya.

The strengthening agent is finely divided cellulose, or a water-insol. cross-linked dextran, sodium carboxymethyl-cellulose or starch-acrylonitrile graft copolymer.

The compsn. prepd. can be easily shaped as required need by controlling the amt. of mineral oil. 8.6.77 as 804692(4pp931)

CLIN- ★ D22 67890B/37 ★US 4166-087
Static vapour generator for air treatment - has syneresis pad cooperating with gel body to give uniform vapour generation
CLINE-BUCKNER INC 04.02.75-US-547015 (22.11.71-US-200968)
J04 (28.08.79) B01f-03/04

The generator comprises a vapour producing gel body cont -g. a gelling agent and a coacting air treatment liq. system. The gel body is positioned in contact with a syneresis pad which absorbs liq. squeezed out of the gel body. The exposed area of the syneresis pad increases as the exposed area of the gel body decreases so that the overall exposed area of the gel body and pad tends to remain constant.

Used for treating air with medicament, decongestants, inhalants, insecticides and deodorants. The generator does not require a propellant but uses automatic intermittent air movement to dispense accumulated vapours into the region to be treated. The syneresis pad provides uniform vapour generation over the life-time of the generator. 4.2.75 as 547015(+29.2.74-US-446915)(8pp67)

AMSA ★ D22 67896B/37 ★US 4166-096
Steam steriliser for treating highly infectious articles - produced no biologically unsafe discharge
AMERICAN STERILISER CO 23.03.78-US-889383
P34 (28.08.79) A61l-03

A steriliser for treating highly infectious material comprises a chamber having an access door but no drain line. Steam is supplied to the chamber to achieve saturated steam at sterilising conditions. An exhust system for the chamber includes a bacteria-retentive filter and a vacuum source.

The chamber cincludes at least one dam, and pref. two, to form a reservoir for the condensate to prevent it from escaping when the chamber door is opened.

There is no discharge which is not biologically safe. 23.3.78 as 889383(5pp295)

INTM ★ D22 67908B/37 ★US 4166-121
Controlling growth of bacteria, e.g. in starch adhesives - by applying prod. obtd. from nitro:alcohol and amine starting materials
INT MINERALS & CHEM CORP 14.09.78-US-942206 (01.10.76-US-728695)
E13 G03 H01 (28.08.79) A01n-09

Growth of bacteria is controlled by the application of a prod. (I) obtd. by (a) reacting a nitroalcohol of formula $C(R)(R')(NO_2)-CH_2OH$ (where R and R' are each H, CH_3, C_2H_5 or CH_2OH) in a 1:1 mole ratio with an amine of formula R^2NH_2 (where R^2 is 1-4C alkyl, phenyl, benzyl, toluyl or xylyl) at 50-70°C to form a nitroamine; (b) reacting the nitroamine with nitrous acid at 0-5°C to form a nitroso cpd., and (c) reducing the nitroso cpd.

Prod. (I) are partic effective in aq. systems such as starch adhesives and solns., oil drilling muds and water dilutable cutting oils based on petroleum hydrocarbons, and are generally used at a conc. of 100-2000 ppm US 4148803 described the prepn. of prods. (I). 14.9.78 as 942206 Div. ex 4148803 (+23.2.78-US-880687)(5pp990)

CARB- D22 22411B/12 =US 4166-292
Joint prosthesis element - having a carbon coated graphite body encircled by a metal pressure band
CARBOMEDICS INC (GEAT) 08.09.77-US-831488
*L02 P32 (04.09.79) *EP---1-147 A61f-01/24*

A stress-reinforced joint prosthesis element for prolonged implantation includes a degree isotropic graphite substrate of the same modulus of elasticity as bone and having a bone joining and an articulating joint surface which result in transverse tensile strain in the element when axially loading; a dense, smooth, low friction wear coating of dense adherent isotropic pyrolytic carbon on the articulating surface; and a metal band in closely conforming relationship with the pyrolytic carbon with a compressive load to produce a strain of less than 0.3% at the perimeter and has a modulus of elasticity 5 times the carbon substrate. The band reduces the tensile strain upon axial loading but does not carry any of the compressive load upon application of skeletal loads. 8.9.77 as 831488. (6pp1376)

JOHJ D22 02572A/02 =US 4166-464

Absorbent bandage contg. thin flexible support film - e.g. of compsn. contg. elastomeric block copolymer and resin component (NL 28.12.77)

JOHNSON & JOHNSON 13.05.77-US-796794 (23.06.76-US-699104)

*A96 P32 P34 +P21 (04.09.79) *DT2728-349 +A61f-17/18*

Highly flexible and conformable disposable absorbent dressing comprises a layer of absorbent material, and a thin flexible, elastic and easily stretchable thermoplastic backing film retained in superimposed relationship with the absorbent layer.

The backing film has (a) an elastic recovery from 50% stretch of $\not>$75%; (b) a rubber modulus of $\not>$ 2000 pounds per sq. inch at 50% elongation; and (c) a Gurley stiffness at a thickness of 1 mil. of $\not>$ 1.

Used to mfr. diapers, surgical and first aid dressings, catamenial dressings, hospital pads, sanitary napkins, etc. 13.5.77 as 796794. (10pp997)

STAD ★ D22 67999B/37 ★US 4166-725

Fuel compsns. stable against microbial growth on storage - contg. biocidal oil-soluble boron cpds. and propylene-di:amine deriv.

STANDARD OIL CO (IND) 15.10.74-US-514496

C01 E12 H06 (C03 E16) (04.09.79) C10l-01/22

Fuel compsn. comprises a major propn. of hydrocarbon fuel boiling at 70-750°F, 0.0005-0.05% by wt. of a mixt. of $2,2^1$-oxybis-(4,4,6-trimethyl-1,3,2-dioxaborinane) (I) and $2,2^1$-(1-methyltrimethylenedioxy)-bis-(4-methyl-1,3,2-dioxaborinane) (II) and 0.0005-0.05% by wt. of a propylenediamine deriv. of formula (III) $H_2NCH_2CH_2CH_2NHR$ (R is alkyl having an average chain length of 11 C).

The fuel compsn. has bactericidal and fungicidal properties and is storage stable against microbial growth even when tetra-alkyl-lead cpds. are absent. Since the (I), (II) and (III) biocides are soluble in the fuel, protection is conferred when it is transferred from tank-to-tank. The combined biocides have a synergistic broad spectrum of activity and are economical. 15.10.74 as 514496. (4pp1248)

SUNO ★ D22 68039B/37 ★US 4166-797

Lubricating oil contg. friction modifying compsn. - comprising co-sulphurised blend of tri:glyceride e.g. lard oil and olefin

SUNTECH INC 15.05.78-US-905910 (19.04.71-US-135466)

E17 H07 (04.09.79) C10m-01/38 C10m-03/32 C10m-05/22 C10m-07/36

The compsn. comprises a major amt. of a lubricating oil and a minor portion of co-sulphurised blend of 70-88 pts. vol. triglyceride (I), whose fatty acid moieties (all hydrocarbon) contain 9-22C atoms, $\not>$45% of them contg. a -C=C- bond, and 30-12 pts. vol. of a 2-24C olefin of formula $R_1R_2C{=}CR_3R_4$ (where R_1, R_2, R_3 are H or alkyl and R_4 is H, (cyclo)alkyl or (alk)aryl). The blend contains 7.5-25wt.% chemically combined S and the compsn. is free of haze after 16 hrs. at 36°F.

The pref. S content is 16-25wt.% (of which 5-18wt.% (based on wt. of blend) is active S. Pref. (I) is lard oil and the olefin is pref. 15-20C α-olefin.

The sulphurised blend is used, as a replacement for sulphurised sperm oil, as a friction modifier for e.g., gear oils, worm and spur gears, transmission fluids, way lubricants, Permawick lubes for sintered bronze or sintered babbit bearings, and as a metal-working oil additive. By sulphurising (I) and the olefin together, the prod. has good lubricity and is soluble in paraffins (separate sulphurisation of the ingredients giving paraffin insoluble pr ds.) 15.5.78 as 905901 (+24.1.72; 14.9.73-US-220399; 397473) (8pp757)

* 1. 1980 SUBSCRIPTION RENEWALS

All Derwent subscribers and online users should now have received 1980 brochures and order forms. Additional sets of these may be obtained on request.

To ensure continuation of your subscription and the incorporation of any changes for 1980, you are urged to submit completed order forms without delay. May we remind you that in addition to the normal postal delays affecting your order, our production figures need to be set some six weeks in advance. If you have not yet renewed may we ask for your cooperation to enable us to make a smooth transition to your 1980 requirements.

We shall be pleased to clarify any points about our products and, if your patent information requirements have changed, to help you evaluate which products and services are now best suited to your needs. Relatively inexpensive changes to your current subscription may well enable you to provide a much more effective service to your own users.

2. ELECTRICAL PATENTS INDEX

Electrical Patents Index (EPI) is an important new service providing for the electrical and electronics industries just the kind of detailed treatment and full indexing previously available only for chemical patents through our CPI service. Plans are now at an advanced stage with the first issue scheduled for January 1980.

An advance copy of the EPI Users Manual and a further copy of the World Patents Abstracts brochure which includes subscription details were despatched to all Derwent subscribers in mid-October. Further copies and additional information may be obtained from Derwent in London.

* 3. DECISIONS FOLLOWING THE 1979 SUBSCRIBER MEETINGS

An addendum to the "Report of Decisions and Points of Action Resulting From 1979 CPI Subscribers' Meetings", which was issued on 25th July, has been prepared and is enclosed with this Newsletter.

other has one of the above meanings.

4. 1979 CENTRALISED INSTRUCTION CLASSES

Centralised Instruction Classes in Washington DC will shortly be held as detailed below.

In recent weeks a large number of new requests and alterations to previous requirements have been received. These are being acknowledged in writing, but should notification not arrive in time delegates can safely assume that they may attend. For this reason details of location and times are given here.

WASHINGTON D. C.

Sheraton National Motor Hotel, Columbia Pike and Washington Blvd., Arlington VA 22204. Tel. (703) 521 1900.

Monday Nov. 12th Tuesday Nov. 13th	IC7	Advanced Coding & Retrieval Sections BCE
Thursday Nov. 15th Friday Nov. 16th	IC6	Advanced Coding & Retrieval Section A

The cost for these centralised classes will be $50 per person per day. Classes will commence at 9.00 a.m. on each day. Participants are asked to bring their own copies of relevant Instruction Manuals for use at these classes.

*5. U.S. OFFICE

Dr. Brian Gore, Marketing Manager is at present available in our U.S.A. Office to answer subscribers' queries until Friday 16th November. From Monday 26th November to Friday 7th December. Mr. George Tobey, Assistant Marketing Manager, will replace Dr. Gore.

Subscribers are reminded that the address of our USA Office is Suite 605, 1735 Jefferson Davis Highway, Arlington, VA 22202, telephone number (703) 521 7977, telex number (international only) 248416 DERW.

* 6. NEW CHEMICAL CODE

A meeting of the coding sub-committee was held in London on 25th and 26th October to discuss comments and suggestions made by members of Subscriber Committee Number 5 on Derwent's latest proposals for a new Chemical Code.

A report of this meeting will be sent during the week commencing 5th November to all members of Committee Number 5. This report will set out our final proposals for the new code which will be presented to all CPI Sections B, C and E subscribers well in advance of the 1980 CPI Subscriber Meetings.

An Instruction Manual on the new code is currently being prepared and will be sent to members of Committee 5 early in 1980 for their evaluation.

7. MAGNETIC TAPE PRODUCTS 1980

A new Instruction Manual - No. 7 - has been printed and a copy sent to all existing subscribers to magnetic tape products. This gives a full description of the tape products available in 1980 which, in several ways, differ from those available previously.

A limited number of further copies are available, on request, from our Data Processing Division.
